Biomaterials for Surgical Operation Shuko Suzuki,Yoshito Ikada,2011-12-21 Biomaterials for Surgical Operation offers a review of the latest advances made in developing bioabsorbable devices for surgical operations which include surgical adhesives sealants barriers for the prevention of tissue adhesion polymers for fractured bone fixation growth factors for the promotion of wound healing and sutures Over the years many descriptions of biomaterials have appeared in academic journals and books but most of them have been devoted to limited clinical areas This is in marked contrast with this volume which covers a wide

range of bioabsorbable devices used in surgery from a practical point of view The currently applied polymeric devices are critical in surgery but all involve serious problems due to their poor performance For instance fibrin glue the most widely used surgical sealant can produce only a weak gel with low adhesive strength to tissues accentuating the limited effectiveness of current treatment options Likewise the currently available barrier membranes cannot fully prevent tissue adhesion at the acceptable level and are moreover not easy to handle with endoscopes due to their poor mechanical properties Biomaterials for Surgical Operation is aimed at those who are interested in expanding their knowledge of how the problems associated with the currently used devices for surgical operation can be solved It primarily focuses on the absorbable biomaterials which are the main components of these medical devices *Yearbook of Intensive Care and Emergency Medicine 2002* Prof. Jean-Louis Vincent, 2013-11-11 The Yearbook compiles the most recent widespread developments of experimental and clinical research and practice in one comprehensive reference book The chapters are written by well recognized experts in the field of intensive care and emergency medicine It is addressed to everyone involved in internal medicine anesthesia surgery pediatrics intensive care and emergency medicine Consultative Hemostasis and Thrombosis E-Book Craig S. Journois,1997-09-01 Hemofiltration is now recognised as the optimal therapeutic solution for supplying renal function in patients with acute renal failure associated with poor hemodynamic conditions This situation is often observed in patients with severe impairment in the function of one or several other organs Since its introduction in the intensive care units in the 1970s hemofiltration has been subject to some major improvements regarding the required material and devices such as catheters lines filters or pumps This progress has been accompanied by a better knowledge of the management of patients undergoing the technique especially concerning nutritional support drug administration control of body temperature as well as fluid and electrolytes balance or cost control Moreover some additional beneficial effects of hemofiltration have been recently pointed out suggesting that this technique could provide more than an already efficient renal support by removing some substances responsible for an exaggar
