

# EVOLUTION OF STARS

After 10 billion years, the small star will run out of hydrogen and starts fusing helium, which causes the star to expand to a red giant

Planetary Nebula

After the star runs out of helium, the star will try to combine carbon, which the star can't combine. So the gas spreads apart from the star leaving behind a carbon dense white dwarf.

Small Star

Red Giant

White Dwarf

When the white dwarf runs out of its remaining energy, it loses its brightness and becomes a brown dwarf.

After the star explodes, the star can do two different things based on its size

1. It can form a very dense NEUTRON STAR
2. It can form the most densest object in the universe, a BLACK HOLE

Supernova

When a massive star runs out of hydrogen, it expands and will make all kind of elements until it starts forming Iron
