Indium Nitride and Related Alloys Timothy David Veal, Christopher F. McConville, William J. Schaff, 2011-06-03 Written by recognized leaders in this dynamic and rapidly expanding field Indium Nitride and Related Alloys provides a clear and comprehensive summary of the present state of knowledge in indium nitride InN research It elucidates and clarifies the often confusing and contradictory scientific literature to provide valuable and rigorous insight into the structural optical and electronic properties of this quickly emerging semiconductor material and its related alloys Drawing from both theoretical and experimental perspectives it provides a thorough review of all data since 2001 when the band gap of InN was identified as 0.7 eV The superior transport and optical properties of InN and its alloys offer tremendous potential for a wide range of device applications including high efficiency solar cells and chemical sensors Indeed the now established narrow band gap nature of InN means that the InGaN alloys cover the entire solar spectrum and InAlN alloys span from the infrared to the ultraviolet However with unsolved problems including high free electron density difficulty in characterizing p type doping and the lack of a lattice matched substrate indium nitride remains perhaps the least understood III V semiconductor Covering the epitaxial growth experimental characterization theoretical understanding and device potential of this semiconductor and its alloys this book is essential reading for both established researchers and those new to the field

III-Nitride Semiconductors M.O. Manasreh, 2000-12-06 Research advances in III nitride semiconductor materials and device have led to an exponential increase in activity directed towards electronic and optoelectronic applications There is also great scientific interest in this class of materials because they appear to form the first semiconductor system in which extended defects do not severely affect the optical properties of devices The volume consists of chapters written by a number

of leading researchers in nitride materials and device technology with the emphasis on the dopants incorporations impurities identifications defects engineering defects characterization ion implantation irradiation induced defects residual stress structural defects and phonon confinement This unique volume provides a comprehensive review and introduction of defects and structural properties of GaN and related compounds for newcomers to the field and stimulus to further advances for experienced researchers Given the current level of interest and research activity directed towards nitride materials and devices the publication of the volume is particularly timely Early pioneering work by Pankove and co workers in the 1970s yielded a metal insulator semiconductor GaN light emitting diode LED but the difficulty of producing p type GaN precluded much further effort The current level of activity in nitride semiconductors was inspired largely by the results of Akasaki and co workers and of Nakamura and co workers in the late 1980s and early 1990s in the development of p type doping in GaN and the demonstration of nitride based LEDs at visible wavelengths These advances were followed by the successful fabrication and commercialization of nitride blue laser diodes by Nakamura et al at Nichia The chapters contained in this volume constitutes a mere sampling of the broad range of research on nitride semiconductor materials and defect issues currently being pursued in academic government and industrial laboratories worldwide

Gap Semiconductors S. J. Pearton, 2013-01-15 Wide bandgap semiconductors made from such materials as GaN SiC diamond and ZnSe are undergoing a strong resurgence in recent years principally because of their direct bandgaps which give them a huge advantage over the indirect gap SiC. As an example more than 10 million blue LEDs using this technology are sold each month and new high brightness 15 lumens per watt long life white LEDs are under development with the potential to replace incandescent bulbs in many situations. This book provides readers with a broad overview of this rapidly expanding technology bringing them up to speed on new discoveries and commercial applications. It provides specific technical applications of key processes such as laser diodes LEDs and very high temperature electronic controls on engines focusing on doping etching oxidation passivation growth techniques and more.

Gallium Nitride Processing for Electronics, Sensors and Spintronics Stephen J. Pearton, Cammy R. Abernathy, Fan Ren, 2006-07-06 Semiconductor spintronics is expected to lead to a new generation of transistors lasers and integrated magnetic sensors that can be used to create ultra low power high speed memory logic and photonic devices. Useful spintronic devices will need materials with practical magnetic ordering temperatures and current research points to gallium and aluminium nitride magnetic superconductors as having great potential. This book details current research into the properties of III nitride semiconductors and their usefulness in novel devices such as spin polarized light emitters spin field effect transistors integrated sensors and high temperature electronics. Written by three leading researchers in nitride semiconductors the book provides an excellent introduction to gallium nitride technology and will be of interest to all researchers and industrial practitioners wishing to keep up to date with developments that may lead to the next generation of transistors lasers and integrated magnetic sensors.

Dilute Nitride Semiconductors Mohamed Henini, 2004-12-15 This book contains full account of the advances made in the dilute nitrides providing an excellent starting point for workers entering the field. It gives the reader easier access and better evaluation of future trends. Conveying important results and current ideas. Includes a generous list of references at the end of each chapter providing a useful reference to the III-V-N based semiconductors research community. The high speed lasers operating at wavelength of 1.3 μm and 1.55 μm are very important light sources in optical communications since the optical fiber used as a transport media of light has dispersion and attenuation minima respectively at these wavelengths. These long wavelengths are exclusively made of InP based material InGaAsP/InP. However there are several problems with this material system. Therefore there has been considerable effort for many years to fabricate long wavelength laser structures on other substrates especially GaAs. The manufacturing costs of GaAs based components are lower and the processing techniques are well developed. In 1996 a novel quaternary material GaInAsN was proposed which could avoid several problems with the

existing technology of long wavelength lasers In this book several leaders in the field of dilute nitrides will cover the growth and processing experimental characterization theoretical understanding and device design and fabrication of this recently developed class of semiconductor alloys They will review their current status of research and development Dilute Nitrides III N V Semiconductors Physics and Technology organises the most current available data providing a ready source of information on a wide range of topics making this book essential reading for all post graduate students researchers and practitioners in the fields of Semiconductors and Optoelectronics Contains full account of the advances made in the dilute nitrides providing an excellent starting point for workers entering the field Gives the reader easier access and better evaluation of future trends conveying important results and current ideas Includes a generous list of references at the end of each chapter providing a useful reference to the III V N based semiconductors research community

State-of-the-Art Program on Compound Semiconductors 57 (SOTAPOCS 57) Y.-L. Wang, V. Chakrapani, T. Anderson, J. Zavada, C. Abernathy, J. Hite, 2015 Wide Band Gap Semiconductor Nanowires 2 Vincent Consonni, Guy Feuillet, 2014-08-08 This book the second of two volumes describes heterostructures and optoelectronic devices made from GaN and ZnO nanowires Over the last decade the number of publications on GaN and ZnO nanowires has grown exponentially in particular for their potential optical applications in LEDs lasers UV detectors or solar cells So far such applications are still in their infancy

which we analyze as being mostly due to a lack of understanding and control of the growth of nanowires and related heterostructures Furthermore dealing with two different but related semiconductors such as ZnO and GaN but also with different chemical and physical synthesis methods will bring valuable comparisons in order to gain a general approach for the growth of wide band gap nanowires applied to optical devices
