Electron Crystallography Nato Asi Series E Applied Sciences Volume 347:

Electron Crystallography D. Dorset, Sven Hovmöller, Xiaodong Zou, 2013-04-17 The re emergent field of quantitative electron crystallography is described by some of its most eminent practitioners They describe the theoretical framework for electron scattering specimen preparation experimental techniques for optimum data collection the methodology of structure analysis and refinement and a range of applications to inorganic materials including minerals linear polymers small organic molecules including those used in nonlinear optical devices incommensurately modulated structures including superconductors alloys and integral membrane proteins The connection between electron crystallography and X ray crystallography is clearly defined especially in the utilisation of the latest methods for direct determination of crystallographic phases as well as the unique role of image analysis of high resolution electron micrographs for phase determination Even the aspect of multiple beam dynamic diffraction once dreaded because it was thought to preclude ab initio analysis is considered as a beneficial aid for symmetry determination as well as the elucidation of crystallographic phases and as a criterion for monitoring the progress of structure refinement Whereas other texts have hitherto preferentially dealt with the analysis of electron diffraction and image data from thin organic materials this work discusses with considerable optimism the prospects of looking at harder materials composed of heavier atoms Audience Could be used with profit as a graduate level course on electron crystallography Researchers in the area will find a statement of current progress in the field

Electron Crystallography Thomas E. Weirich, János L. Lábár, Xiaodong Zou, 2006-08-18 During the last decade we have been witness to several exciting achievements in electron crystallography This includes structural and charge density studies on organic molecules complicated inorganic and metallic materials in the amorphous nano meso and quasi crystalline state and also development of new software tailor made for the special needs of electron crystallography Moreover these developments have been accompanied by a now available new generation of computer controlled electron microscopes equipped with high coherent field emission sources cryo specimen holders ultra fast CCD cameras imaging plates energy filters and even correctors for electron optical distortions Thus a fast and semi automatic data acquisition from small sample areas similar to what we today know from imaging plates diffraction systems in X ray crystallography can be envisioned for the very near future This progress clearly shows that the contribution of electron crystallography is quite unique as it enables to reveal the intimate structure of samples with high accuracy but on much smaller samples than have ever been investigated by X ray diffraction As a tribute to these tremendous recent achievements this NATO Advanced Study Institute was devoted to the novel approaches of electron crystallography for structure determination of nanosized materials
