*Environmental and Natural Resource Mathematics* Robert W. McKelvey, 1985 This volume is the proceedings of the AMS Short Course held in Eugene Oregon in August 1984 The discussions explored the fascinating role that mathematicians and mathematically trained scientists have played throughout the development of the discipline of natural resource modeling and in economic theory in general Also discussed were ways in which concepts and techniques of modeling might best be incorporated into graduate and undergraduate mathematics education The term natural resources should be interpreted broadly encompassing air and water resources land and soil minerals and oil energy resources and such biological resources as fisheries agricultural crops forests and wildlife The objective of the Short Course and of this volume is to demonstrate that despite the great diversity of kinds of natural resources a coherent theory has developed concerning the efficient and conservative management of resources and that this theory has a substantial mathematical component

**Probabilistic Combinatorics and Its Applications** Bl̃a Bollob̃s (ed), Fan R. K. Chung, 1991 Probabilistic methods have become a vital tool in the arsenal of every combinatorialist The theory of random graphs is still a prime area for the use of probabilistic methods and over the years these methods have also proved of paramount importance in many associated areas such as the design and analysis of computer algorithms In recent years probabilistic combinatorics has undergone revolutionary changes as the result of the appearance of some exciting new techniques such as martingale inequalities discrete isoperimetric inequalities Fourier analysis on groups eigenvalue techniques branching processes and rapidly mixing Markov chains The aim of this volume is to review briefly the classical results in the theory of random graphs and to present several of the important recent developments in probabilistic combinatorics together with some applications

The first paper contains a brief introduction to the theory of random graphs The second paper reviews explicit constructions of random like graphs and discusses graphs having a variety of useful properties Isoperimetric inequalities of paramount importance in probabilistic combinatorics are covered in the third paper The chromatic number of random graphs is presented in the fourth paper together with a beautiful inequality due to Janson and the important and powerful Stein Chen method for Poisson approximation The aim of the fifth paper is to present a number of powerful new methods for proving that a Markov chain is rapidly mixing and to survey various related questions while the sixth paper looks at the same topic in a very different context For the random walk on the cube the convergence to the stable distribution is best analysed through Fourier analysis the final paper examines this topic and proceeds to several more sophisticated applications Open problems can be found throughout each paper

**Mathematical Aspects of Artificial Intelligence** Frederick Hoffman, American Mathematical Society, 1998 There exists a history of great expectations and large investments involving artificial intelligence AI There are also notable shortfalls and memorable disappointments One major controversy regarding AI is just how mathematical a field it is or should be This text includes contributions that examine the connections between AI and mathematics demonstrating the potential for mathematical applications and exposing some of the more mathematical areas within AI The goal is to stimulate interest in people who can contribute to the field or use its results Included in the work by M Newborn on the famous Deep Blue chess match He discusses highly mathematical techniques involving graph theory combinatorics and probability and statistics G Shafer offers his development of probability through probability trees with some of the results appearing here for the first time M Golumbic treats temporal reasoning with ties to the famous Frame Problem His contribution involves logic combinatorics and graph theory and leads to two chapters with logical themes H Kirchner explains how ordering techniques in automated reasoning systems make deduction more efficient Constraint logic programming is discussed by C Lassez who shows its intimate ties to linear programming with crucial theorems going back to Fourier V Nalwa's work provides a brief tour of computer vision tying it to mathematics from combinatorics probability and geometry to partial differential equations All authors are gifted expositors and are current contributors to the field The wide scope of the volume includes research problems research tools and good motivational material for teaching

*Cryptology and Computational Number Theory* Carl Pomerance, Shafi Goldwasser, 1990 In the past dozen or so years cryptology and computational number theory have become increasingly intertwined Because the primary cryptologic application of number theory is the apparent intractability of certain computations these two fields could part in the future and again go their separate ways But for now their union is continuing to bring ferment and rapid change in both subjects This book contains the proceedings of an AMS Short Course in Cryptology and Computational Number Theory held in August 1989 during the Joint Mathematics Meetings in Boulder Colorado These eight papers by six of the top experts in the field will provide readers with a thorough introduction to some of the principal advances in cryptology and computational number

theory over the past fifteen years In addition to an extensive introductory article the book contains articles on primality testing discrete logarithms integer factoring knapsack cryptosystems pseudorandom number generators the theoretical underpinnings of cryptology and other number theory based cryptosystems Requiring only background in elementary number theory this book is aimed at nonexperts including graduate students and advanced undergraduates in mathematics and computer science
