CONCEPT OF ENVIRONMENT AND ITS IMPORTANCE – POLLUTION AND HEALTH HAZARD

Meaning and Definition:

The term environment has been derived from a French word “Environia” means to surround. It refers to both abiotic (physical or non-living) and biotic (living) environment. The word environment means surroundings, in which organisms live. Environment and the organisms are two dynamic and complex component of nature. Environment regulates the life of the organisms including human beings. Human beings interact with the environment more vigorously than other living beings. Ordinarily environment refers to the materials and forces that surrounds the living organism.

Environment is the sum total of conditions that surrounds us at a given point of time and space. It is comprised of the interacting systems of physical, biological and cultural elements which are interlinked both individually and collectively. Environment is the sum total of conditions in which an organism has to survive or maintain its life process. It influences the growth and development of living forms. In other words environment refers to those surroundings that surrounds living beings from all sides and affect their lives in toto. It consists of atmosphere, hydrosphere, lithosphere and biosphere. It's chief components are soil, water, air, organisms and solar energy. It has provided us all the resources for leading a comfortable life.

1. According to P. Gisbert “Environment is anything immediately surrounding an object and exerting a direct influence on it.”
2. According to E. J. Ross “Environment is an external force which influences us.”

Thus, environment refers to anything that is immediately surrounding an object and exerting a direct influence on it. Our environment refers to those thing or agencies which though distinct from us, affect our life or activity. The environment by which man is surrounded and affected by factors which may be natural, artificial, social, biological and psychological.

IMPORTANCE AND SCOPE

The environment is the context in which the system we are interested in is found. Strictly speaking, it is whatever is not included in our definition of the system. In developing a systems perspective we describe a system in relationship to its environment, and how changes in the environment affect the system.

When describing a system in the context of its environment we speak about the “response” and the “behavior” of the system. The response of a system is how it changes when the environment changes in a particular way. The more general description of a system in the context of diverse conditions is its “behavior”.
