Environmental Radon C.Richard Cothorn,James E. Smith,1987-11-30 This volume is intended for the professional who is a newcomer to the area of environmental radon It marks the first time that chapters on these subjects have been brought together in a single volume and it is arranged so that anyone with some basic university level chemistry and physics can develop a clear understanding of the different aspects involved The volume is intended to serve as a supplementary textbook in public health environmental and health physics courses It also can be used by the professional to get up to speed in this rapidly evolving field The chapters are not necessarily a discussion of the latest research in this fast moving field but are intended to bring the reader to a level at which he can easily understand the current literature At the back of this volume the reader will find the references for the individual chapters a general list of reading materials a glossary an appendix describing the equations for radioactive decay for a series of progeny a table of often used conversion factors and the addresses and brief biographies of the authors and editors Both historical and SI International System units are used throughout the book to provide information for the widest range of readers Thanks go to Tom Hess for the idea for this volume and to Jessica Barron for help in editing

Home Buyer's and Seller's Guide to Radon United States. Environmental Protection Agency. Office of Air and Radiation,2000 *Clay's Handbook of Environmental Health* Stephen Battersby,W.H. Bassett,2004-05-27 This classic definitive reference work for all those involved in environmental health is now available in its 19th edition Significant changes include those made to chapters on food safety and hygiene environmental protection the organisation and management of environmental health in the UK port health and waste management New chapters have been added on health development an introduction to health and housing contaminated land and environmental health in emergency planning as well as a new glossary of abbreviations and acronyms New material on training and standards IT practical risk assessment and investigatory powers is also included

Each chapter reflects the wider background against which the subjects must be studied and the new concepts and approaches that have emerged over the past few years **Risk-Based Environmental Decisions** Douglas J.

Crawford-Brown, 2012-12-06 Risk Based Environmental Decision Methods and Culture presents the principles of human health risk analysis as they are applied in environmental decisions It balances the discussion of scientific theory and methods philosophical analysis and applications in regulatory decisions The material is directed towards risk analysts who must apply their skills in a policy setting and towards policy analysts who must use risk estimates The presentation is suited ideally as an introductory text on the methods of risk analysis and on the cultural issues that underlie these methodologies An important feature of Risk Based Environmental Decision Methods and Culture is that it is designed around a series of detailed case studies of environmental risk analysis which walk the reader from the historical nature of the problem to the formulation as a risk based problem to the conduct of risk analysis and on to the application debate and defense of the risk analysis

Low-Level Environmental Radioactivity Richard Tykva, Jozef Sabol, 1995-04-13 From the Introduction Low level radioactivity is related to those radioactive sources of ionizing radiation that are characterized by low activities Sometimes activity here does not represent total amount of radionuclides but rather their concentration In other cases the total activity may be quite high but we can measure only a relatively small portion of the material Low may have for different situations and circumstances not only considerably different meanings but also different absolute values as far as the activity or activity concentration is concerned For example one can refer to low activity in the case of radiocarbon dating where the concentration of ^{14}C is actually lower than its natural concentration and also in the case of radon monitoring where especially in mines or in some enclosed spaces its concentration may be several thousand times higher than the outdoor natural concentrations Emphasis is now being placed on the analysis of naturally occurring radionuclides in the environment or on the release of radionuclides from their different man made sources because liquid and aerial discharge level controls have become more rigorous In addition the applicability of low level methodology increases the extent of different radionuclide applications considerably Since individual radionuclides differ in their decay scheme and particles emitted as well in their energies there is no universal method for the accurate measurement of all radioactive sources Moreover there is usually a mixture of radionuclides in a sample causing some difficulties in a selective evaluation of a given radionuclide Due to the random nature of radioactive disintegrations the appropriate interpretation of the experimental results would be in most cases impossible without elaborate statistical treatment and evaluation of the data obtained Thanks to the availability of computer based instrumentation the measuring data can be in most cases processed and evaluated on line which makes it possible to control and optimize the experiment in order to extract the maximum amount of information carried by the detector response The purpose of this book is to provide an introduction to low level radioactivity assessment and to clarify the nature of its sources as well as the principal methods used in its measurement Our evaluation is concentrated on the

present day aspects of low level methodology The book may be useful for all who need highly sensitive analysis of natural or artificial radioactivity both within and outside the nuclear field The attempt of this book is to summarize the sources of environmental radioactivity and their possible radiological impact in terms of resulting doses to the population and to present a sound review of the measuring methods and techniques for the evaluation of low level radioactivities encountered in both the environment and in a number of applications where radioactive sources are used as a means of obtaining important information
