Environmental Management Low Grade:

The Environmental Management of Low-Grade Fuels Mary MacDonald, Michael Chadwick, Gareg Aslanian, 2013-11-05 The negative environmental impacts of energy use particularly soil and water pollution continue to present serious policy dilemmas The release of emissions and effluents and the build up of solid waste throughout the fuel cycle have disruptive effects on natural habitats and human health Further fuel combustion can result in the emission of carbon dioxide ozone methane and nitrogen dioxide the greenhouse gases which have been linked to climate change The safe and sustainable use of energy has become an important issue in the wider environmental debate In this report researchers from the Stockholm Environment Institute explore the issues raised by the use of low grade fuels such as peat wood biomass lignite oil shale and municipal and industrial wastes The present strategies and policy options for all stages of the process from mining and transport to processing and combustion With those who would like to learn more about these fuels in mind the material is presented clearly and discussions of environmental protection measures are given in table form throughout the ease of reference A directory of environmental guidelines regulations and standards is given in an appendix While a high calorific value fuels remain the most significant source of energy in many countries economic and other constraints on the use of these fuels may result in more nations turning to low grade sources of energy to operate their industrial or transportation sectors The greater potential for environmental degradation that accompanies the use of low grade fuels means that it is crucial that environmentally sound methods for their management such as those presented here be more widely available The Environmental Management of Low Grade Fuels will be valuable for industry specialists policy makers students and all who are concerned with the life cycle of these materials Mary MacDonald is an affiliated scientist and Michael Chadwick is a former director at the Stockholm Environment Institute Garegin Aslanian is a senior associate with the Institute for High Temperature Research in Moscow Originally published in 1996

The Environmental Management of Low-grade Fuels M. E. MacDonald, Michael J. Chadwick, G. S. Aslanian, 1996 Low grade fuels are those with a low calorific value per unit weight such as peat wood lignite and municipal waste consequently they frequently emit a higher percentage of pollutant material after use than higher grade fuels Methods to reduce or eliminate environmental damage caused by these pollutants do exist but are often relatively costly This book offers specific realistic strategies and policy options for managing these fuels with a minimum of damage to the environment

development of new technologies to enable cleanup and minimize costs while meeting various health safety and environmental objectives While DOE has a process based on stakeholder participation for screening and formulating technology needs it lacks transparency in terms of being apparent to all concerned decision makers and other interested parties and a systematic basis in terms of identifying end states for the contaminants and developing pathways to these states from the present conditions An End State Methodology for Identifying Technology Needs for Environmental Management with an Example from the Hanford Site Tanks describes an approach for identifying technology development needs that is both systematic and transparent to enhance the cleanup and remediation of the tank contents and their sites The authoring committee believes that the recommended end state based approach can be applied to DOE waste management in general not just to waste in tanks The approach is illustrated through an example based on the tanks at the DOE Hanford Site in southeastern Washington state the location of some 60 percent by volume of the tank waste residues
