Advanced Biological Treatment Processes Lawrence K. Wang, Nazih K. Shammass, Yung-Tse Hung, 2010-03-10 The past 30 years have seen the emergence of a growing desire worldwide that positive actions be taken to restore and protect the environment from the degrading effects of all forms of pollution air water soil and noise Because pollution is a direct or indirect consequence of waste the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste continues to exist we can only attempt to abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved This book is one of the volumes of the Handbook of Environmental Engineering series The principal intention of this series is to help readers formulate answers to the last two questions above The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However the realization of the ever increasing complexity and interrelated nature of current environmental problems renders it imperative that intelligent planning of pollution abatement systems be undertaken

Annual ,1979 **Analysis of Selected Enhancements for Soil Vapor Extraction** ,1997 This report provides an engineering analysis of and status report on selected enhancements for soil vapor extraction SVE treatment technologies The report is intended to assist project managers considering an SVE treatment system by providing them with an up to date status of enhancement technologies an evaluation of each technology s applicability to various site conditions a presentation of cost and performance information a list of vendors specializing in the technologies a discussion of relative strengths and limitations of the technologies recommendations to keep in mind when considering the enhancements and a compilation of references The performance of an SVE system depends on properties of both the contaminants and the soil SVE is generally applicable to compounds with a vapor pressure of greater than 1 millimeter of mercury at 20EC and a Henry s Law constant

of greater than 100 atmospheres per mole fraction SVE is most effective at sites with relatively permeable contaminated soil and with saturated hydraulic conductivities of greater than 1×10 or 1×10 centimeter per second cm s SVE by itself does not effectively remove contaminants 3×2 in saturated soil However SVE can be used as an integral part of some treatment schemes that treat both groundwater and the overlying vadose zone Enhancement technologies should be considered when contaminant or soil characteristics limit the effectiveness of SVE or when contaminants are present in saturated soil The five enhancement technologies covered in this report are as follows and are described in the following subsections Air Sparging Dual phase Extraction Directional Drilling Pneumatic and Hydraulic Fracturing Thermal Enhancement
