Environmental Stratified Flows Cism International Centre For Mechanical Sciences:

Environmental Stratified Flows Vincenzo Armenio, Sutanu Sarkar, 2007-03-07 Stratified flows common in environmental and geophysical applications are characterized by the variation of fluid density in the vertical direction that can result in qualitative and quantitative modifications of the flow patterns by buoyancy. Unstable stratification (dense water above light water) increases the vertical mixing by generation of convective cells, while stable stratification generally suppresses vertical mixing of mass and momentum. Even so, a stably stratified fluid can support internal waves, instabilities, and turbulence that play a critical role in transport and mixing. The ocean is predominantly subject to stable stratification, which under external excitation supports an environment of internal waves which may then break and generate turbulence. Wind forcing, currents, and convective plumes are other sources of turbulence in the ocean. In the ocean, stratified turbulence mediates the upward transport of bottom water nutrients, chemical and biological species, and pollutants. In the atmosphere, stratification affects the transport of pollutants released at ground level, a critical problem being the thermal inversion in urban areas that causes the stagnation of pollutants and small particulate PM_{2.5} to PM₁₀ in the lower part of the atmospheric boundary layer. In buildings, stratification governs the circulation of air and heat in natural ventilation systems.

Environmental Stratified Flows Vincenzo Armenio, Sutanu Sarkar, 2009-08-29 This book covers the theory of stratified flows from basic concepts to recent developments in environmental fluid mechanics. State-of-the-art numerical techniques suited for stratified flows are given along with results of recent research in the areas of environmental stratified flows. The book offers a unified view of stratified turbulent flows from small-scale mixing to large-scale environmental phenomena, including detailed discussion on interaction between turbulence and internal gravity waves. Mixing and Dispersion in

Flows Dominated by Rotation and Buoyancy Herman J.H. Clercx, Gert-Jan F. Van Heijst, 2017-10-24 The book presents a state-of-the-art overview of current developments in the field in a way accessible to attendees coming from a variety of fields. Relevant examples are turbulence research, environmental fluid mechanics, lake hydrodynamics, and atmospheric physics. Topics discussed range from the fundamentals of rotating and stratified flows, mixing and transport in stratified or rotating turbulence, transport in the atmospheric boundary layer, the dynamics of gravity and turbidity currents, eventually with effects of background rotation or stratification, mixing in stratified lakes, and the Lagrangian approach in the analysis of transport processes in geophysical and environmental flows. The topics are discussed from fundamental experimental and numerical points of view. Some contributions cover fundamental aspects, including a number of the basic dynamical properties of rotating and/or stratified turbulent flows, the mathematical description of these flows, some applications in the natural environment, and the Lagrangian statistical analysis of turbulent transport processes and turbulent transport of material particles, including for example inertial and finite size effects. Four papers are dedicated to specific topics such as transport in stratified lakes, transport and mixing in the atmospheric boundary layer, mixing in stratified fluids, and dynamics of turbidity.
