A Field Guide to Tropical Plant Families Roland Keller, 2023-03-12 This book provides an identification system permitting recognition of plant families in all seasons by means of morphological and macroanatomical features which are easily observable such as bark exudates stems and leaves characters Studies of forest vegetation may differ in their underlying objectives but they all require taxonomic knowledge The process of taxonomy begins with an inventory of the flora which has been based to a large extent on reproduction related organs such as flowers and fruits But those are often difficult to observe and may not exist in the field at a given time Unlike most such guides or keys this book can be used anywhere in the tropics and provides in a straightforward two or three step process identification to the level of families which are now circumscribed according to molecular as well as morphological characters in the universally accepted scheme of the Angiosperm Phylogeny Group Plant architecture is not a prerequisite theme for plant identification however we think that an introduction to this subject is not out of place in this book architectural traits are taxonomically sound it is now time for botanists working in the tropics to have an idea on how the whole organism keeps growing Within the family accounts there is information concerning important economic plants with notes on the larger genera and particularly helpfully discussion of families readily confused and how to separate them Descriptions of the families rely on short diagnosis bolstered by many photographic pictures lines drawings and extracts from the author's field books all showing features of plants as they are found in the forest

Garden Plants Taxonomy

Bijan Dehgan,2023-04-05 Horticulture has remained far behind in

understanding of botanical principles Recent phylogenetic DNA based reorganization of higher plants has revolutionized taxonomic treatments of all biological entities even when morphology does not completely agree with their organization This book is an example of applying principals of botanical phylogenetic taxonomy to assemble genera species and cultivars of 200 vascular plant families of ferns gymnosperms and angiosperms that are cultivated for enhancement of human living space homes gardens and parks The emphases are on cultivated species but examples of some plants are often shown in the wild and in landscapes In providing descriptions it is assumed that students and other interested individuals have no background in general botany plant characteristics or nomenclature Fundamental features of all plant groups discussed are fully

illustrated by original watercolor drawings or photographs Discussion of the families is grounded on recent botanical phylogenetic treatments which is based on common ancestry monophyly Of course phylogenetic taxonomy is not a new concept and was originally based on morphological characteristics it is the DNA based phylogeny that has revolutionized modern biological classifications In practical terms this book represents the horticultural treatment that corresponds to phylogenetic based botanical taxonomy to which is added cultigens and cultivated genera and species Hence the harmony between horticultural and botanical taxonomy This book covers phylogenetic based taxonomy of Angiosperms Eudicots A companion volume covers Ferns Gymnosperms and Angiosperms Monocots
