Hierarchical

Emergent Ontology and the Universal Principle of Emergence Vladimír Havlík, 2022-04-12 This book offers a new look at emergence in terms of a hierarchical emergent ontology Emergence is recognised as a universal principle as universal as the principle of evolution This is achieved by setting out the ontological criteria of emergence and such criteria's various roles The traditional dichotomies are overcome e.g. the synchronic and diachronic perspectives are unified allowing a single universal principle of emergence to be applied across various fields of science As exemplars of its practical utility in both explanation and prediction this new approach is applied to three different scientific areas cellular automata quantum Hall effects and the neural network of the mind It proves that the resulting metaphysics of hierarchical emergent ontology plays a fundamental role in unifying science an impossible task under classical reductionism [Creation Myths of the World](#) David A.  Mugerauer, 2008-10-21 Martin Heidegger's philosophical works devoted themselves to challenging previously held
 ontological notions of what constitutes being and much of his work focused on how beings interact within particular spatial
 locations Frequently Heidegger used the motifs of homelessness and homecoming in order to express such spatial
 interactions and despite early and continued recognition of the importance of homelessness and homecoming this is the first
 sustained study of these motifs in his later works Utilizing both literary and philosophical analysis Heidegger and
 Homecoming reveals the deep figural unity of the German philosopher's writings by exploring not only these homecoming
 and homelessness motifs but also the six distinctive voices that structure the apparent disorder of his works In this
 illuminating and comprehensive study Robert Mugerauer argues that these motifs and Heidegger's many voices are required
 to overcome and replace conventional and linear methods of logic and representation Making use of material that has been
 both neglected and yet to be translated into English Heidegger and Homecoming explains the elaborate means with which
 Heidegger proposed that humans are able to open themselves to others while at the same time preserve their self identity

 Pinder, P.S. Cranston, 2012-12-06 The dipteran family Chironomidae is the most widely distributed and frequently the most
 abundant group of insects in freshwater with representatives in both terrestrial and marine environments A very wide range
 of gradients of temperature pH oxygen concentration salinity current velocity depth productivity altitude and latitude have
 been exploited by at least some chironomid species and in grossly polluted environments chironomids may be the only insects
 present The ability to exist in such a wide range of conditions has been achieved largely by behavioural and physiological
 adaptations with relatively slight morphological changes It has been estimated that the number of species world wide may be
 as high as 15000 This high species diversity has been attributed to the antiquity of the family relatively low vagility leading to
 isolation and evolutionary plasticity In many aquatic ecosystems the number of chironomid species present may account for
 at least 50% of the total macroinvertebrate species recorded This species richness wide distribution and tolerance to adverse
 conditions has meant that the group is frequently recorded in ecological studies but taxonomic difficulties have in the past
 prevented non specialist identification beyond family or subfamily level Recent works including genetic studies have meant
 that the family is receiving much more attention globally *Journal of the Optical Society of America and Review of
