**The Handbook of Zoonotic Diseases of Goats** Tanmoy Rana, 2024-11-18. Goats are the predominant domestic livestock and certainly the predominant small ruminant in most of Asia, Africa and the warmer parts of Europe. Important for meat, milk, fibre and leather production, their widescale production and husbandry allows many opportunities for the spread of disease between livestock and their keepers. Taking a One Health approach to the issue, this book provides clear, accurate and comprehensive coverage of the zoonotic diseases of goats. Including information on aetiology, the epidemiology and transmission cycle, clinical symptoms, diagnosis and prevention and control strategies. An invaluable resource for veterinary practitioners and public health experts around the world, this book also provides a useful reference for researchers and students of animal disease and human health.

This book reviews the etiology of major zoonotic diseases, their impact on human health and control mechanisms for better management. It also examines factors influencing transmission, diagnosis, treatment, management and prevention of zoonotic diseases caused by different human pathogens including bacteria, viruses, fungi, protozoans and parasites. It also introduces zoonoses with a wildlife reservoir and discusses different transmission modes and factors that influence the epidemiology of zoonoses. It further discusses the holistic strategies for the cost-effective prevention and control of these zoonoses. Towards the end, the book also discusses infections that have spread from non-human primates to humans and strategies to improve disease control and elimination. *Emergence and Control of Zoonotic Viral Encephalitides* Charles H. Calisher, Diane E. Griffin, 2013-12-01. In this period of obvious natural emergence of viral and other diseases, it is unclear as to what diseases are emerging, why they are emerging and what, if anything, can be done to prevent or diminish their impact. This book, a compendium of presentations made at an international meeting of experts, provides summaries of areas of concern and details as to how disease agents such as Nipah and Hendra viruses in Australasia and West Nile virus in the Americas might have suddenly appeared. Either by alterations in natural habitats and diversity or by chance, pathogens emerge from time to time. This book addresses various aspects of such emergences such as pathogenetic mechanisms of viruses, diagnosis of viral infections, viral host management strategies, viral genetics, vaccine development and application. It is especially valuable for laboratory virologists, disease ecologists, physicians and those who want to understand

Barrett, V. Deubel, 2012-12-06 Japanese encephalitis and West Nile viruses are members of the Japanese encephalitis serological group of the genus Flavivirus and therefore closely related genetically and antigenically They share a number of properties including the use of birds as their major wildlife maintenance host and Culicine mosquitoes for transmission and they are both associated with severe human disease as well as fatal infections in horses The emergence of these two viruses and their well established propensity to colonise new areas make it timely to re examine their ecology biology molecular structure replication and epidemiology and these therefore provide the focus of this volume

Avian Influenza and Newcastle Disease Illaria Capua, Dennis J. Alexander, 2009-06-24 Avian Influenza AI and Newcastle Disease ND are two devastating diseases of poultry which cause losses to the poultry industry and influence the liveability of rural communities worldwide Following the H5N1 epidemic they appear to be endemic at least in Asia Eastern Europe The Middle East and Africa Particularly in case of AI outbreaks it is essential that infection is diagnosed promptly and that isolates are made available to the international scientific community Currently several organisations including OIE FAO and the EC have organised training courses in affected areas However often these courses do not cover all aspects of AI ND diagnosis but only certain aspects This results in fragmented areas of knowledge and in the application of different diagnostic protocols in different parts of the world The objective of this book is to provide a comprehensive approach to AI diagnosis ranging from the clinical elements that should trigger a suspicion in the field to the post mortem technique collection of samples processing shipment of specimens virological serological and molecular diagnosis and guidelines for notification

**Agents Transmissible from Simians to Man** Manfred Brack, 2012-12-06 The contacts between man and nonhuman primates enable the transmission of microorganisms from one species to the other Such contact may occur at quite different levels man and nonhuman primates may share the same ecosystem including the presence of vectors in the countries of origins of monkeys and apes the animals are captured to be sold or used for food field researchers have to stay near the animals in the wild an uncontrolled human population gets close enough to almost touch the animals in zoological gardens around the world pet owners establish bodily contact and finally researchers doing surgery or necropsies are exposed to an increased number of pathogens liberated from the organs and body fluids Usually monkeys and apes are more threatened with catching the microorganisms indigenous to man than vice versa but nevertheless outbreaks of true zoonoses with nonhuman primates as the source of infection have occurred Also the retransmission of originally human pathogens via nonhuman primates to man may pose a considerable risk to human health Unfortunately the information on the different agents transmissible between man and his relatives is too disseminated for practical use as it involves quite different scientific disciplines such as virology bacteriology parasitology primatology laboratory animal science etc It seemed therefore necessary to compile the current knowledge concerning this topic in a single publication Human infections of simian origin may be caused by several viruses bacteria fungi or endoparasites Ectoparasites in comparison are of little importance
