Handbook of Pain and Aging David I. Mostofsky, Jacob Lomranz, 2013-11-11 From time to time professional journals and edited volumes devote some of their pages to considerations of pain and aging as they occur among the aged in different cultures and populations One starts from several reasonable assumptions among them that aging per se is not a disease process yet the risk and frequency of disease processes increase with ongoing years The physical body s functioning and ability to restore all forms of damage and insult slow down the immune system becomes compromised and the slow growing pathologies reach their critical mass in the later years The psychological body also becomes weaker with unfulfilled promises and expectations and with tragedies that visit individuals and families and the prospect that whatever worlds remain to be conquered will most certainly not be met with success in the rapidly passing days and years that can only culminate in death Despair and depression coupled with infirmity and sensory and or motor inefficiency aggravate both the threshold and the

tolerance for discomfort and synergistically collaborate to perpetuate a vicious cycle in which the one may mask the other. Although the clinician is armed with the latest advances in medicine and pharmacology, significant improvement continues to elude her or him. The geriatric specialist, all too familiar with such realities, usually can offer little else than a hortative to learn to live with it, but the powers and effectiveness of learning itself have declined.

Nutrition, Aging, and the Elderly D.E. Danford, H.N. Munro, 2013-11-11. The proportion of the population over 65 years of age is increasing steadily in most industrialized countries. In the United States, the proportion of elderly people has risen from four percent in 1900 to 11 % in 1978 and is projected to be 14% by the year 2000. The occurrence of debilitating chronic diseases in the elderly increases with each additional year. These diseases, along with the natural loss of tissue function that occurs

throughout adult life impose a heavy burden on the health care system Nutrition plays an important etiologic role in many of these degenerative changes Consequently the aging segment of the population presents a challenge to the nutrition scientist who should be able to recommend optimal intakes of nutrients to minimize the functional losses associated with aging and to optimize the health of those already elderly This sixth volume in the series Human Nutrition A Comprehensive Treatise provides a conspectus of the various interactions of nutrition with the aging process and a comprehensive survey of current knowledge of the amounts of individual nutrients needed by the elderly The volume begins with a general survey of the multifaceted relationship of nutrition to aging followed by four chapters on how nutrition can affect age related changes in selected body functions The next six chapters cover the available evidence regarding the needs of the elderly for dietary energy protein calcium trace elements vitamins and fiber Alcohol and Coffee Use in the Aging Ronald Ross

Watson,2000-09-28 As we age our physiology changes Also we tend to place less emphasis on proper nutrition The more elderly we grow the less resistant we become to major diseases such as cancer and heart disease This state of affairs renders the elderly more vulnerable to alcohol and other drugs of abuse Alcohol and tobacco are routinely used together Chroni
