statistical graphics computer science and operations research have created the rich set of methods now called Analytics. Often analytics is characterized along three poles: descriptive analytics (what do data tell us), predictive analytics (what can be forecast based on the data and with what certainty), and prescriptive analytics (how can the data inform changes to improve system performance). This book focuses on the second pole, predictive analytics. The areas of predicting a number, a class, and dynamic behavior are distinct with different methods. This text has three parts based on these areas. Topics in predicting a number include simple and multiple linear regression, transformation of variables, analysis of observational data via cross validation, the generalized linear model, designed experiments, and Gaussian process and neural network regression. Classification methods include neural networks, logistic regression, k nearest neighbor, and linear discriminant analysis. Methods for predicting dynamic behavior include trend analysis, time series analysis, and discrete event dynamic simulation. Characterizing prediction uncertainty is a key focus of this text. The text provides analytic methods appropriate to each area with an explicit process for applying such methods. Case data with corresponding R code are used to illustrate each method. Predictive Analytics for Business using R is designed for a hybrid class structure. Class sessions can be a blend of lecture format and flipped classroom case analyses. In a two meetings per week, fifteen week structure, one day per week would be devoted to explaining methodology and presenting a case study, with the second day focused on coaching. Given the case structure, the text does not contain homework problems. Instead, at the end of each chapter, there are links to cases posted online.

**Computational Probability** Winfried K. Grassmann, 2013-03-14. Great advances have been made in recent years in the field of computational probability. In particular, the state of the art as it relates to queueing systems, stochastic Petri nets, and systems dealing with reliability has benefited significantly from these advances. The objective of this book is to make these topics accessible to researchers, graduate students, and practitioners. Great care was taken to make the exposition as clear as possible. Every line in the book has been evaluated, and changes have been made whenever it was felt that the initial exposition was not clear enough for the intended readership. The work of major research scholars in this field comprises the individual chapters of *Computational Probability*. The first chapter describes, in nonmathematical terms, the challenges in computational probability. Chapter 2 describes the methodologies available for obtaining the transition matrices for Markov chains, with particular emphasis on stochastic Petri nets. Chapter 3 discusses how to find transient probabilities and transient rewards for these Markov chains. The next two chapters indicate how to find steady state probabilities for Markov chains with a finite number of states. Both direct and iterative methods are described in Chapter 4. Details of these methods are given in Chapter 5. Chapters 6 and 7 deal with infinite state Markov chains, which occur frequently in queueing because there are times one does not want to set a bound for all queues. Chapter 8 deals with transforms, in particular Laplace transforms. The work of Ward Whitt and his collaborators, who have recently developed a number of numerical methods for Laplace transform

inversions is emphasized in this chapter Finally if one wants to optimize a system one way to do the optimization is through Markov decision making described in Chapter 9 Markov modeling has found applications in many areas three of which are described in detail Chapter 10 analyzes discrete time queues Chapter 11 describes networks of queues and Chapter 12 deals with reliability theory

*Knowledge-Based and Intelligent Information and Engineering Systems* Rossitza Setchi,Ivan Jordanov,2010-08-30 The four volume set LNAI 6276 6279 constitutes the refereed proceedings of the 14th International Conference on Knowledge Based Intelligent Information and Engineering Systems KES 2010 held in Cardiff UK in September 2010 The 272 revised papers presented were carefully reviewed and selected from 360 submissions They present the results of high quality research on a broad range of intelligent systems topics

**Recent Developments in Operational Research** Manju Lata Agarwal,Kanar Sen,2002-05-01 This volume brings out recent developments and current activity in different areas of operational research The topics covered include the following major areas mathematical programming queuing theory reliability and maintenance inventory and production control statistical methods networks and sequencing and information technology Recent Developments in Operational Research will be of considerable value and interest to operational researchers both theoreticians and practitioners as well as a reference source for research workers
