## **Graphite Fibers And Filaments:**

*Graphite Fibers and Filaments* Mildred S. Dresselhaus, Gene Dresselhaus, Ko Sugihara, Ian L. Spain, Harris A. Goldberg, 2013-03-08 This book was begun after three of the present authors gave a series of invited talks on the subject of the structure and properties of carbon filaments. This was at a conference on the subject of optical obscuration for which submicrometer diameter filaments with high length to diameter ratios have potential applications. The audience response to these talks illustrated the need of just one scientific community for a broader knowledge of the structure and properties of these interesting materials. Following the conference it was decided to expand the material presented in the conference proceedings. The aim was to include in a single volume a description of the physical properties of carbon fibers and filaments. The research papers on this topic are spread widely in the literature and are found in a broad assortment of physics, chemistry, materials science and engineering and polymer science journals and conference proceedings, some of which are obscure. Accordingly, our goal was to produce a book on the subject which would enable students and other researchers working in the field to gain an overview of the subject up to about 1987.

**Graphite Fibers and Filaments** Mildred S. Dresselhaus, Gene Dresselhaus, Ko Sugihara, 1988-06-10

*Carbon Fibers and Their Composites* Peter Morgan, 2005-05-20

Most literature pertaining to carbon fibers is of a theoretical nature. *Carbon Fibers and their Composites* offers a comprehensive look at the specific manufacturing of carbon fibers and graphite fibers into the growing surge of diverse applications that include flameproof materials, protective coatings, biomedical and prosthetics application.

**Carbon Fibers Filaments and Composites** J.L. Figueiredo, Carlos A. Bernardo, R.T.K. Baker, K.J. Hüttinger, 2013-03-14

Conventional synthetic materials like metals, ceramics or glass are usually isotropic substances and their suitability for structural applications is achieved by morphological design and combination in the macroscopic scale. However, in modern engineering this is often not acceptable. As an alternative, the use of non-homogeneous anisotropic materials with significant stiffness and strength only in the directions these mechanical properties are really needed can lead to enormous material and weight savings. This is the case of multiphase systems called composite materials. In these composites, different material parts are added and arranged geometrically under clearly designed and controlled conditions. Usually, a structure of fibers provides strength and stiffness and a matrix holds them together whilst providing the geometric form. Carbon fibers are among the high performance fibers employed in these advanced structural composites which are profoundly changing many of today's high technology industries. New research and development challenges in this area include upgrading the manufacturing process of fibers and composites in order to improve characteristics and reduce costs and modifying the interfacial properties between fibers and matrix to guarantee better mechanical properties. The interdisciplinary nature of this new frontier is obvious, involving chemistry, materials science, chemical and mechanical engineering. Other topics which more often are treated separately are also important for the understanding of the processes of fiber production. Carbon filaments is one

such topic as the study of their mechanisms of nucleation and growth is clearly quite relevant to the production of vapour grown carbon fibers

**Carbon Fibers** Leighton H. Peebles, 2018-01-18 Carbon Fibers presents an up to date review of the progress pertaining to the formation of carbon fibers from rayon acrylic and pitch precursors The book emphasizes the preparation characterization and properties of commercial materials It also considers the compressive properties of carbon fibers the lack of correlation between surface characterization and fiber matrix interactions and the discrepancy between surface composition as determined by XPS and the reaction of surface groups with chemical reagents Other topics discussed include

Wachtman, 2009-09-28 This volume is part of the Ceramic Engineering and Science Proceeding CESP series This series contains a collection of papers dealing with issues in both traditional ceramics i e glass whitewares refractories and porcelain enamel and advanced ceramics Topics covered in the area of advanced ceramic include bioceramics nanomaterials composites solid oxide fuel cells mechanical properties and structural design advanced ceramic coatings ceramic armor porous ceramics and more

**Carbon Fibers** Soo-Jin Park, 2014-10-08 This book contains eight chapters that discuss the manufacturing methods surface treatment composite interfaces microstructure property relationships with underlying fundamental physical and mechanical principles and applications of carbon fibers and their composites Recently carbon based materials have received much attention for their many potential applications The carbon fibers are very strong stiff and lightweight enabling the carbon materials to deliver improved performance in several applications such as aerospace sports automotive wind energy oil and gas infrastructure defense and semiconductors However the use of carbon fibers in cost sensitive high volume industrial applications is limited because of their relatively high costs However its production is expected to increase because of its widespread use in high volume industrial applications therefore the methods used for manufacturing carbon fibers and carbon fiber reinforced composites and their structures and characteristics need to be investigated
