

**diffusion equation, elementary**

The equation obtained by using Fick's law to relate the current density to the neutron density in a continuity equation.

**diffusion length**

A length appearing in the description of diffusion when Fick's law applies. It is the square of the diffusion length (called the *diffusion area*) equal to one-sixth the mean square distance traveled by a particle of a given type or class from appearance to disappearance within an infinite homogeneous medium.

**diffusion, molecular (isotopes separation)**

A process whereby one substance gradually interpenetrates another substance as a result of the continuous thermal motion of the individual molecules. Diffusion due to molecular motion satisfies a partial differential equation of the form

$$\frac{\partial \rho}{\partial t} = D \frac{\partial^2 \rho}{\partial x^2}$$

where  $\rho$  is the density of the material diffusion,  $t$  is the time and  $x$  is distance in the direction of the density gradient. The quantity  $D$  is known as the **coefficient of diffusion** for the mixture in question; it turns out to be rate-determining in all separation processes using gases or liquids at pressures where molecular collisions are a significant phenomenon.

**diffusivity (chemical engineering)**

The relative rate of flow per unit area of a particular constituent of a mixture divided by the gradient of composition, temperature or other property considered to be causing the diffusion. Also *diffusion coefficient*.

The atom so displaced eventually comes to rest at an interstitial position or at a lattice edge.
