Dams and Development World Commission on Dams, 2016-05-13 By the year 2000 the world had built more than 45 000 large dams to irrigate crops generate power control floods in wet times and store water in dry times Yet in the last century large dams also disrupted the ecology of half the

world's rivers displaced tens of millions of people from their homes and left nations burdened with debt. Their impacts have inevitably generated growing controversy and conflicts. Resolving their role in meeting water and energy needs is vital for the future and illustrates the complex development challenges that face our societies. The Report of the World Commission on Dams is the product of an unprecedented global public policy effort to bring governments, the private sector and civil society together in one process. It provides the first comprehensive global and independent review of the performance and impacts of dams, presents a new framework for water and energy resources development, develops an agenda of seven strategic priorities with corresponding criteria and guidelines for future decision making. Challenging our assumptions, the Commission sets before us the hard, rigorous and clear-eyed evidence of exactly why nations decide to build dams and how dams can affect human, plant and animal life for better or for worse. *Dams and Development: A New Framework for Decision Making* is vital reading on the future of dams as well as the changing development context where new voices, choices and options leave little room for a business as usual scenario. *After the Anthropocene* Anne Fremaux, 2019-03-25. The environmental crisis is the most prominent challenge humanity has ever had to battle with and humanity is currently failing. The Anthropocene or so-called age of humans is indeed a period when the survival of humanity has never been so much at risk. This book locates itself in the field of critical green political theory. Fremaux's analysis of the current environmental crisis calls for us to embrace radical shifts in our modes of being or in other words socially progressive innovations that will be described within the unique framework of Green Republicanism. In offering a constructive and emancipatory delineation of what could be considered an ecological civilization that is respectful of its natural environment and social differences, this book describes how to shift from an arrogant speciesism and materialistic lifestyle to a post anthropocentric ecological humanism focusing on the good life within ecological limits. This new political regime calls for a radical reinvention of our societies, a decentering of the humans within our metaphysical worldview and a withdrawal of the capitalist technosphere at the benefit of the biosphere. It will require a new economic paradigm that replaces the unsustainable capitalist logic of growth by sustainable degrowth and steady economics. Rooted in ethical thinking and political philosophy, this book seeks to offer a concrete roadmap of how sustainable societies can be fostered. **Improving water management in agriculture** Professor Jerry W. Knox, 2024-06-11. Provides a comprehensive overview of the interventions available to optimise water management in agriculture including rainwater harvesting and farm reservoirs. Considers the development and application of alternative irrigation techniques which carry a reduced environmental impact such as solar powered irrigation. Addresses the importance of diversification and collaboration in securing water resources for a rapidly growing population. **The Power of Science** Domenico Rossetti di Valdalbero, 2010. The Future of Oil as a Source of Energy The Emirates Center for Strategic Studies and Research, 2002-08-12 This book examines various aspects of the future of oil as a source of energy including future oil supply oil demand and market stability It reflects the analysis and assessments of the energy experts who gathered at the ECSSR's Sixth Annual Energy Conference entitled The Future of Oil as a Source of Energy Although the future supply of oil is difficult to forecast due to many uncertainties around production and reserve data it is estimated that oil from the Gulf and other non syndicated oil producing regions will form the larger part of global oil supplies after 2010 The volume also explores the potential of alternative energy sources like gas hydrogen and renewable sources Despite the projected increase in energy demand due to population growth and higher standards of living in the developed world heightened environmental concerns and policies to reduce damaging emissions are likely to reduce oil's share in the energy market over time A combination of conversion technologies and energy sources including natural gas renewable energy and hydrogen now has the potential to form more than niche markets in the currently oil dominated energy sector at least in certain parts of the globe Nevertheless it is expected that oil will continue to be the energy source of choice for most regions
