

Complete Hard Disk Encryption Using FreeBSD's GEOM Framework

Marc Schiesser

m.schiesser [at] quantentunnel.de

October 20th 2005

Abstract

Most technologies and techniques intended for securing digital data focus on protection while the machine is turned *on* – mostly by defending against remote attacks. An attacker with *physical* access to the machine, however, can easily circumvent these defenses by reading out the contents of the storage medium on a different, fully accessible system or even compromise program code in order to leak encrypted information.

Especially for mobile users, that threat is *real*. And for those carrying around sensitive data, the risk is most likely *high*.

This paper describes a method of mitigating that particular risk by protecting not only the data through encryption, but also the applications and the operating system from being compromised while the machine is turned *off*.

The platform of choice will be FreeBSD, as its GEOM framework provides the flexibility to accomplish this task. The solution does not involve programming, but merely relies on the tools already provided by FreeBSD.
