

A close-up photograph of a cluster of ladybird beetles (Coccinellidae) on a dry, light-colored twig. The beetles are predominantly orange-red with black spots and markings. Some beetles are facing the camera, showing their dorsal view, while others are positioned to show their ventral view, which is black with white or yellow spots. The background is a soft, out-of-focus brown, suggesting a natural, wooded environment.

Ecology Of Coccinellidae:

Ecology of Coccinellidae Ivo Hodek, Alois Honek, 2013-03-09 Coccinellids have been very actively studied in the course of the twenty three years since *Biology of Coccinellidae* was published. The great amount of new and often very important findings have made the previous book outdated and a new synthesis is needed. No other monograph of similar focus and extent has appeared. Iablokoff Khnzorian's *Les Coccinelles* 1982 limited to the tribus Coccinellini and Gordon's *The Coccinellidae of America North of Mexico* 1985 both concentrate on taxonomy. Majerus' beautiful *Ladybirds* 1994 deal specifically with British coccinellids and address chiefly amateur naturalists. The focus and the title of the recent book are slightly different from the 1973 volume. If a satisfactory comprehensive review of important new findings is attempted the book would grow too much. Due also to References and Indexes. To keep the volume at a tolerable extent the section on larval identification of Palaearctic species has been omitted. Not much could be added to the previous version of that part anyway. However we have kept Kovar's chapter on morphology and anatomy because of its relation to feeding and other ecological aspects. The chapter on phylogeny was updated also by him. Our Polish friend Piotr Ceryngier who has recently specialised in parasites updated perfectly the parts on parasites and pathogens in Chapter 8. We would be glad if their contribution is quoted by their names. It seems to us that the remarks contained in the reprinted preface to the previous volume remain pertinent today.

Ecology and Behaviour of the Ladybird Beetles (Coccinellidae) Ivo Hodek, A. Honek, Helmut F. van Emden, 2012-04-19 Ladybirds are probably the best known predators of aphids and coccids in the world though this greatly underestimates the diversity of their biology. Maximising their impact on their prey is an important element in modern conservation biological control of indigenous natural enemies in contrast to the classical approach of releasing alien species. Ivo Hodek is one of the most internationally respected experts on coccinellids who has researched these insects for his entire career. He has now brought together 14 scientists of international standing to author 12 chapters making this book the definitive treatment of coccinellid biology and ecology. This volume covers the rapid scientific developments of recent years in the understanding of coccinellid phylogeny, the semiochemicals influencing their behaviour and of molecular genetics. Recent insights in relation to intraguild predation and the assessment of the predatory impact of coccinellids are also covered. Other special features of the volume are the extensive references covering the literature from both East and West and a taxonomic glossary of the up to date nomenclature for species of coccinellids as well as of other organisms mentioned in the text. While aimed at researchers, university teachers and agricultural entomologists the book is readable and appropriate for others who just have a liking for these interesting and attractive insects.

Aphid Biodiversity under Environmental Change Pavel Kindlmann, A.F.G. Dixon, J.P. Michaud, 2010-07-01 This book presents the results of recent research on aphid population dynamics and ecology relevant to current environmental changes resulting from global warming. It incorporates a selection of the contributions presented at the International Symposium on Aphids in Fremantle, Australia in October 2005 plus some ad

tional invited chapters The objective was to incorporate the major issues in the field and simultaneously create a closely interrelated and integrated volume The first chapter sets the scene Kindlmann and Dixon present a critical review of existing models of aphid population dynamics examine the biological assumptions that are incorporated in the models and present one of the latest models of aphid metapopulation dynamics They conclude that natural enemies are unlikely to affect aphid population dynamics late in a season but in some years may have an effect very early in the season when aphid colonies are still small and predators might be able to reduce the numbers of colonies The question whether aphids will move to different locations adapt to the change in conditions in their current habitat or go extinct is discussed by Ameixa She concludes that the distributions of aphids are most likely to change with the distribution of each species moving globally as their preferred habitat moves in response to changes in the climate which may be more difficult than in the past because of habitat fragmentation and habitat loss

From Biological Control to Invasion: the Ladybird *Harmonia axyridis* as a Model Species Helen E. Roy, Eric Wajnberg, 2008-01-26 *Harmonia axyridis* has been

described as the most invasive ladybird on Earth It has a long history of use as a classical biological control agent in the USA and more recently in Europe This beetle has been effective at controlling pest insects in a variety of crop systems but it poses unacceptable risks by impacting on non target species as both an intraguild predator and competitor Written by renowned scientists this book is a synthesis of recent research on *H. axyridis* and provides informative insights into current perspectives and future directions Biological control is an essential component of sustainable agriculture but the distinction between a successful biological control agent and an invasive species can be narrow We hope that lessons can be learnt from *H. axyridis*

Insect Predator-Prey Dynamics A. F. G. Dixon, 2000-06 Much of our understanding about insect predator prey dynamics has been due to studies on insect parasitoids But do true predators such as ladybird beetles really operate in a similar way and how does this affect their use in biological control The extensive literature on ladybirds as biocontrol agents shows that their size and rate of development is very dependent on the nature of their prey This volume explores basic ladybird biology their association with their prey and its effect on development rate and body size Optimal foraging theory field observations and laboratory experiments are used to illustrate how ladybird larvae maximise their rate of energy intake and ladybird adults their fitness The interdependence of these life history parameters is then used to develop a simple predator prey model which with an analysis of the literature highlights

the specific attributes of potentially successful biocontrol agents for all those interested in predator prey dynamics

Nontarget Effects of Biological Control Peter A. Follett,Jian J. Duan,2012-12-06 Nontarget Effects of Biological Control is the first book of its kind The environmental safety of biological control has come under scrutiny due to several areas of concerns the irreversibility of alien introductions the prevalence of host switching to innocuous native or beneficial species dispersal of the biocontrol agent to new habitats away from croplands and the lack of research on the efficacy and impact of biocontrol attempts The debate has been strongly polarized between conservationists and biological control practitioners Nontarget Effects of Biological Control proposes that retrospective analyses of systems in place in which nontarget effects are now documented or suspected provide the necessary information for planning and evaluating future releases to reduce risk The book presents case histories of past biological control introductions from island and continental ecosystems
