Applied Mechanics Reviews ,1974 **Decentralized Spatial Computing** Matt Duckham,2012-07-27 Computing increasingly happens somewhere with that geographic location important to the computational process itself Many new and evolving spatial technologies such as geosensor networks and smartphones embody this trend Conventional approaches to spatial computing are centralized and do not account for the inherently decentralized nature of computing somewhere the limited local knowledge of individual system components and the interaction between those components at different locations On the other hand despite being an established topic in distributed systems decentralized computing is not concerned with geographical constraints to the generation and movement of information In this context of centralized spatial computing and decentralized non spatial computing the key question becomes What makes decentralized spatial computing special In Part I of the book the author covers the foundational concepts structures and design techniques for decentralized computing with spatial and spatiotemporal information In Part II he applies those concepts and techniques to the development of algorithms for decentralized spatial computing stepping through a suite of increasingly sophisticated algorithms from algorithms with minimal spatial information about their neighborhoods to algorithms with access to more detailed spatial information such as direction distance or coordinate location to truly spatiotemporal algorithms that monitor environments that are dynamic even using networks that are mobile or volatile Finally in Part III the author shows how decentralized spatial and spatiotemporal algorithms designed using the techniques explored in Part II can be simulated and tested In particular he investigates empirically the important properties of a decentralized spatial algorithm its computational efficiency and its robustness to unavoidable uncertainty Part III concludes with a survey of the opportunities for connecting decentralized spatial computing

to ongoing research and emerging hot topics in related fields such as biologically inspired computing geovisualization and stream computing The book is written for students and researchers of computer science and geographic information science Throughout the book the author's style is characterized by a focus on the broader message explaining the process of decentralized spatial algorithm design rather than the technical details Each chapter ends with review questions designed to test the reader's understanding of the material and to point to further work or research The book includes short appendices on discrete mathematics and SQL Simulation models written in NetLogo and associated source code for all the algorithms presented in the book can be found on the author's accompanying website

Object Management in Distributed Database Systems for Stationary and Mobile Computing Environments Wujuan Lin, Bharadwaj Veeravalli, 2013-11-21

Network based computing domain unifies all best research efforts presented from single computer systems to networked systems to render overwhelming computational power for several modern day applications Although this power is expected to grow with respect to time due to technological advancements application requirements impose a continuous thrust on network utilization and on the resources to deliver supreme quality of service Strictly speaking network based computing domain has no confined scope and each element offers considerable challenges Any modern day networked application strongly thrives on efficient data storage and management system which is essentially a Database System There have been number of books to date in this domain that discuss fundamental principles of designing a database system Research in this domain is now far matured and many researchers are venturing in this domain continuously due to a wide variety of challenges posed In this book our domain of interest is in exposing the underlying key challenges in designing algorithms to handle unpredictable requests that arrive at a Distributed Database System DDBS and evaluating their performance These requests are otherwise called as on line requests arriving at a system to process Transactions in an on line Banking service Airline Reservation system Video on Demand system etc are few examples of on line requests

Services Computing **Computerworld** ,1981-02 For more than 40 years Computerworld has been the leading source of technology news and information for IT influencers worldwide Computerworld s award winning Web site Computerworld com twice monthly publication focused conference series and custom research form the hub of the world s largest global IT media network Space-Time Computing with Temporal Neural Networks James E. Smith,2022-05-31 Understanding and implementing the brain s computational paradigm is the one true grand challenge facing computer researchers Not only are the brain s computational capabilities far beyond those of conventional computers its energy efficiency is truly remarkable This book written from the perspective of a computer designer and targeted at computer researchers is intended to give both background and lay out a course of action for studying the brain s computational paradigm It contains a mix of concepts and ideas drawn from computational neuroscience combined with those of the author As background relevant biological features are described in terms of their computational and communication properties The brain s neocortex is constructed of massively interconnected neurons that compute and communicate via voltage spikes and a strong argument can be made that precise spike timing is an essential element of the paradigm Drawing from the biological features a mathematics based computational paradigm is constructed The key feature is spiking neurons that perform communication and processing in space time with emphasis on time In these paradigms time is used as a freely available resource for both communication and computation Neuron models are first discussed in general and one is chosen for detailed development Using the model single neuron computation is first explored Neuron inputs are encoded as spike patterns and the neuron is trained to identify input pattern similarities Individual neurons are building blocks for constructing larger ensembles referred to as columns These columns are trained in an unsupervised manner and operate collectively to perform the basic cognitive function of pattern clustering Similar input patterns are mapped to a much smaller set of similar output patterns thereby dividing the input patterns into identifiable clusters Larger cognitive systems are formed by combining columns into a hierarchical architecture These higher level architectures are the subject of ongoing study and progress to date is described in detail in later chapters Simulation plays a major role in model development and the simulation infrastructure developed by the author is described
