in water are pervading features of animal life. They are performed by a huge variety of organisms from the smallest protozoans to the largest whales and can extend over widely different distance scales from the microscopic to global. Integrating the study of movement, dispersal and migration is crucial for a detailed understanding of the spatial scale of adaptation and for analysing the consequences of landscape and climate change as well as of invasive species. This novel book adopts a broad cross taxonomic approach to animal movement across both temporal and spatial scales, addressing how and why animals move and in what ways they differ in their locomotion and navigation performance. Written by an integrated team of leading researchers, the book synthesizes our current knowledge of the genetics of movement, including gene flow and local adaptations, whilst providing a future perspective on how patterns of animal migration may change over time together with their potential evolutionary consequences. Novel technologies for tracking the movement of organisms across scales are also discussed, ranging from satellite devices for tracking global migrations to nanotechnology that can follow animals only a millimetre in size. *Animal Movement Across Scales* is particularly suitable for graduate level students taking courses in spatial animal ecology, animal migration and movement ecology, as well as providing a source of fresh ideas and opinions for those already active within the field. It will also be of interest and use to a broader audience of professional biologists interested in animal movements and migrations. *New Breeder's Gazette*, 1891 [The Zoologist's Guide to the Galaxy](#)

Arik Kershenbaum, 2022-03-15. A wildly fun and scientifically sound exploration of what alien life must be like. Scientists are confident that life exists elsewhere in the universe. Yet rather than taking a realistic approach to what aliens might be like, we imagine that life on other planets is the stuff of science fiction. The time has come to abandon our fantasies of space invaders and movie monsters and place our expectations on solid scientific footing. Using his own expert understanding of life on Earth and Darwin's theory of evolution, which applies throughout the universe, Cambridge zoologist Dr Arik Kershenbaum explains what alien life must be like, how these creatures will move, socialize and communicate. Might there be an alien planet with supersonic animals? A moon where creatures have a language composed of smells? Will aliens scream with fear, act honestly or have technology? *The Zoologist's Guide to the Galaxy* answers these questions using the latest science to tell the story of how life really works on Earth and in space. **The Princeton Field Guide to Dinosaurs**
