

Геодинамика и магматизм Загрос-Кавказского сегмента в фанерозое

Приведены данные и обобщены различные тектонические факторы, объясняющие наличие в платформе геодинамическую полноту в эволюции Земли, вступлении Загрос-Кавказского сегмента в континентальную субдукцию в связи с включением ее в складчатый бассейн Месопотамия, разлитием в основании вулканоглутионических покровов и метасубдукционной проэкспозиции палеогенового магматизма, который по распространности и спектру рудных элементов значительно превосходит островной магматизм архейства. Доказано, что на трех континентальных этапах развития сегмента давление и надвижение расположенных литосферы по плоскостям срывов в зоне глубинных разломов не являются субдукционными процессами. Рассмотрены также прикладное значение геодинамических исследований в формировании геологических рудно-магматических и нефтегазовых систем. Предлагается глубинно-фронтальное прохождение углеводородов, вследствие структурно-геодинамической полноты распространения магматического поля со зрелой континентальной корой в центральной части и молодой морфологической бассейнов с разорванной корой на фронтальной окраине геологическим поясом Загрос-Кавказского сегмента. Для построения широтного профиля, студента и преподавателя вузов.
