## **Fine Structure Of Algal Cells:**

The Fine Structure of Algal Cells John D. Dodge, 2012-12-02 The Fine Structure of Algal Cells is a hybrid between a review and a comprehensive descriptive work on fine structure of algae. Such fine structural data are important for any consideration of the classification of algae and for attempting to analyze their phylogenetic relationships. Fine structure has provided many vital keys to the understanding of the interrelationships and phylogeny of the algae. Notably the trend in algal fine structure work is toward use of electron microscopy to try to understand the functions of cells and organelles under both normal and experimental conditions. This book brings together information which has been gathered by electron microscopists. It considers 13 classes of algae: Chlorophyceae, Haptophyceae, Prasinophyceae, Bacillariophyceae, Chloromonadophyceae, Phaeophyceae, Euglenophyceae, Dinophyceae, Eustigmatophyceae, Cryptophyceae, Xanthophyceae, Rhodophyceae, and Chrysophyceae. It covers the main structural features of the various classes and the organelles present in typical cells. The book also describes the algal cell covering flagella, pyrenoid, eyespot, nucleus, and ejectile organelles as well as membranes, envelope, and stroma of algal chloroplasts. Lastly, it also explains the algal cell division. This book will help students visualize and compare algal structure and at the same time provide enough references so that research workers can enter the literature to find out more precise details from the original sources. **The Fine Structure of Algal Cells [By]**

The book compares homologous structures in different groups within an evolutionary frame of reference. It covers all taxa and structures and it incorporates new concepts that have resulted from Algal Physiology and Biochemistry William Duncan Patterson Stewart, 1974 *Enzymatic Digestion of Algal Cells* Maurice E. **Algal Cell Motility** Michael Melkonian, 2012-12-06 Algae exhibit the greatest variety of cell motility phenomena in the living world. These range from the peculiar gliding motility of filamentous blue green algae or cyanobacteria to chloroplast movements and cytoplasmic streaming which are most common in higher plants. In addition, cell motility by eukaryotic flagella is the characteristic mode of cell locomotion in algal flagellates and most reproductive cells of algae. Algae use these cell motility systems mainly to orient themselves or their photosynthetic organelles in a suitable light gradient to optimize growth and reproduction. In consequence, most of the motility systems are coupled to photoreceptors and are regulated by signal transduction cascades. Algal cell motility has thus attracted considerable interest also from non phycologists and some algal motility systems have become models of research in cell and molecular biology. This book summarizes some of the progress that has been made in recent years in the analysis of cell motility phenomena in the algae. Although complete coverage of the subject was not attempted, the six chapters cover all the major types of cell motility systems and the authors provide in depth reviews of gliding motility, chloroplast movements, cytoplasmic streaming, flagellar beat patterns.
