Finite Element Analysis of Reinforced Concrete Structures Laura N. Lowes, Filip C. Filippou, American Concrete Institute, 2003 Additional Finite Element Method for Analysis of Reinforced Concrete Structures at Limit States Ermakova A.V., 2012 The work presents the theoretical basis of Additional Finite Element Method AFEM which is a variant of the Finite Element Method FEM for analysis of reinforced concrete structures at limit state AFEM adds to the traditional sequence of problem by FEM the units of the two well known methods of the structural design method of additional loads and limit state method The problem is solved by introduction of ideal failure models and additional design diagrams formed from additional finite elements where each AFE describes the limit state reached by the main element The main relations defining the properties of AFEs as well as the examples of the use of Additional Finite Element Method for analysis of reinforced concrete structures at limit state are given in the work too Finite Element Analysis of Reinforced Concrete Structures W. Filippou, 2006 SP-237 CD: Finite Element Analysis of Reinforced Concrete Structures , 2006 *Constitutive Modelling and Finite Element Analysis of Reinforced Concrete Structures* Pui-Lam Ng, 2017-01-27 This dissertation Constitutive Modelling and Finite Element Analysis of Reinforced Concrete Structures by Pui lam Ng was obtained from The University of Hong Kong Pokfulam Hong Kong and is being sold pursuant to Creative Commons Attribution 3 0 Hong Kong License The content of this dissertation has not been altered in any way We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation All rights not granted by the above license are retained by the author Abstract Abstract of thesis entitled CONSTITUTIVE MODELLING AND FINITE ELEMENT ANALYSIS OF REINFORCED CONCRETE STRUCTURES Submitted by NG Pui Lam for the Degree of Doctor of Philosophy at The University of Hong Kong in September 2007 This thesis is divided into two parts The first part is devoted to the development of new constitutive models of reinforced concrete To properly simulate the stress path dependence of concrete the author devises herein the nonlinear damage model In this model the microcracking induced by stressing of concrete is viewed as damage which is described by two quantifiable damage parameters the damaged modulus and the residual strain On the shear behaviour of concrete it is postulated that the shear stress envelope of concrete

is governed by two criteria the Mohr Coulomb criterion of maximum shear stress and the non orthogonal minor crack criterion of maximum shear stress A stress path dependent shear stress strain relation of concrete is established Time dependent analysis of shrinkage and creep effects in concrete structures requires storage of stress histories of finite elements for evaluation of creep This poses a hindrance to the analysis of large problems To circumvent the memorisation of stress histories a new multi layer visco elastic concrete creep model is developed Besides for structures constructed in stages re analysis of the partially completed structure in each stage is necessary in response to changes in structural configurations during construction Herein the locked in strain is introduced to allow analysing altogether the completed and uncompleted portions thus eliminating the efforts on re meshing and location matching of element stresses and deformations The interactions between concrete and reinforcement are simulated in conjunction with the discrete modelling of reinforcing bars The Goodman interface element is adapted for modelling concrete to reinforcement bond with the implementation of nonlinear bond stress slip relation Besides the dowel action for discrete reinforcing bars is modelled based on the beam on elastic foundation theory The second part of this thesis is on the analysis of reinforced concrete structures The tension stiffening phenomenon in cracked concrete beams is investigated From finite element analysis stress distributions at beam cross sections are revealed and based on which a tensile stress block is derived The tensile stress block enables assessment of beam deflections in structural design process without resorting to finite element analysis for each individual beam Furthermore the post peak behaviour of beams and deep beams is analysed The effects of concrete residual strain bond slip and dowel action on beam responses are studied The finite element programme is applied to the analysis of shear transfer across joints between concrete units with particular reference to precast segmental post tensioned bridges To model the epoxy adhesive between joint surfaces the epoxy element is developed from the nonlinear linkage element It is found that with the joint surfaces pressing against each other by prestressing the shear transfer capacity of flat joints is already sufficient comparable to intact concrete and the provision of shear keys at joint surfaces is superfluous from the shear stren

Finite Element Design of Concrete Structures Guenter Axel Rombach,2004 In Finite Element Design of Concrete Structures practical problems and their solutions the author addresses this blind belief in computer results by offering a useful critique that important details are overlooked due to the flood of information from the output of computer calculations Indeed errors in the numerical model may lead in extreme cases to structural failures as the collapse of the so called Sleipner platform has demonstrated **Finite Element Analysis of Reinforced Concrete Structures Under Monotonic Loads**

procedures are close to being practical every day tools for design office engineers Non linear computer analysis procedures can be used to provide reliable assessments of the strength and integrity of damaged or deteriorated structures or of structures built to previous codes standards or practices deemed to be deficient today They can serve as valuable tools in assessing the expected behaviour from retrofitted structures or in investigating and rationally selecting amongst various repair alternatives fib Bulletin 45 provides an overview of current concepts and techniques relating to computer based finite element modelling of structural concrete It summarises the basic knowledge required for use of nonlinear analysis methods as applied to practical design construction and maintenance of concrete structures and attempts to provide a diverse and balanced portrayal of the current technical knowledge recognizing that there are often competing and conflicting viewpoints This report does not give advice on picking one model over another but rather provides guidance to designers on how to use existing and future models as tools in design practice in benchmarking of their models against established and reliable test data and in selecting an appropriate safety factor as well as recognising various pitfalls fib Bulletin 45 is intended for practicing engineers and therefore focuses more on practical application and less on the subtleties of constitutive modelling
