

# Stability Estimates of the Mortar Finite Element Method for 3-Dimensional Problems

Dietrich Braess, Wolfgang Dahmen

## Abstract

This paper is concerned with the mortar finite element method for three spatial variables. The two main issues are the proof of the LBB condition based on appropriate choices of Lagrange multipliers and optimal efficiency of corresponding multigrid schemes for the whole coupled systems of equations. The implementation of the smoothing procedure also differs from that one used in the 2-dimensional case.

**Key words:** Mortar method, domain decomposition, saddle point problems,  $L_2$ -stability of mortar projections, multigrid algorithms, error estimates, efficiency of smoothing procedures.

**AMS subject classification:** 65N55, 65N30, 65F10, 46E35.

## 1 Introduction

The mortar method is a domain decomposition method with non-overlapping subdomains, see e.g. [1, 2, 3, 6]. The matching of discretizations on adjacent subdomains is only enforced weakly which, in particular, facilitates employing *different types* of discretizations on different subdomains. Even in the case when only finite elements are used on each subdomain, and this is the setting to be treated here, this still offers, in principle, the advantage of freely choosing highly varying mesh sizes on different subdomains. This is a very promising feature with regard to abruptly changing diffusion coefficients or local anisotropies.

We view such types of *physical properties* of the underlying problem as a major motivation for employing a mortar technique rather than parallelization. Therefore we are primarily interested in developing highly efficient *multigrid schemes* for the whole coupled system of equations.

In a recent paper [6] such a multigrid algorithm for mortar elements was developed and analyzed with primary focus on the case of two spatial variables. The analysis heavily
