D. Jackson,P. D. Miller,Walter K. Boyd,F. W. Funk,1962 A mechanism for the LOX Titanium reaction was proposed during a previous investigation WADD TR 60 258 It was postulated that the impact of a titanium surface immersed in LOX generates sufficient heat to gasify a pocket of oxygen In addition the impact tends to compress the

oxygen at the local impact sites A rapid reaction occurs at the fresh surface formed by the impact The present investigation has established that a fresh titanium surface formed by rupture of a tensile specimen would react in gaseous oxygen under approximately 100 psig pressure at temperatures as low as about 250F These results tend to substantiate the proposed mechanism Means of eliminating or minimizing the reaction of titanium when ruptured in gaseous oxygen were investigated The addition of HF as a gas to the oxygen resulted in some inhibition Argon reduced the reactivity of oxygen gas by dilution Coating the tensile specimens with fluoride phosphate or with vapor deposited aluminum did not affect the reactivity These same coatings furnished some protection to titanium from reactivity during impact under LOX
