**Designing a Control for a Material Fatigue Testing Machine** Jörg Henseler, 2002-09-10 Diploma Thesis from the year 2001 in the subject Electrotechnology grade 1 3 A University of Kaiserslautern Escuela Superior de Ingenieros de Sevilla Spain course Semester Final Paper language English abstract  
**PROJECT DESCRIPTION** One main field of activity of the Department of Mechanical Engineering and Material Science at the Escuela Superior de Ingenieros de Sevilla is material fatigue testing In order to evaluate material characteristics under specified conditions material probes are outset to biaxial movements i e traction or pressure and torsion The machines for this particular application typically use hydraulics for the power generation the exact movement is achieved by servo ventilis Industrial manufacturers demand at least 300 000 for building a machine like that This appears very expensive keeping in mind the very basic task of the machine Whereas a university of western industrialized countries may bear inversions like that for universities of third world it is hardly possible to procure such a machine This was the motivation for the Department of Mechanical Engineering and Material Science at the Escuela Superior de Ingenieros de Sevilla to start a project in order to find a cheap as well as reliable solution for biaxial material fatigue testing

**Energy Efficiency Improvements in Electric Motors and Drives** Anibal de Almeida, Paolo Bertoldi, Werner Leonhard, 2012-12-06 The reduction of energy consumption through improvements in energy efficiency has become an important goal for all countries in order to improve the efficiency of the economy to increase energy supply security and to reduce the emissions of CO and other pollutants caused by power generation 2 Electric motors use over half of all electricity consumed in developed countries Typically 60 80% of the electricity which is used in the industrial sector and about 35% of the electricity used in the commercial sector in the European Union is consumed by motors In industry a motor consumes an annual quantity of electricity which

corresponds to approximately 5 times its purchase price throughout its whole life of around 12 to 20 years Motors are by far the most important type of electric load They are used in all sectors and in a wide range of applications namely the following fans compressors pumps mills winders elevators transports home appliances and office equipment etc It is their wide use that makes motor drive systems one of the main targets to achieve significant energy savings As motors are the largest users of electrical energy even small efficiency improvements will produce very large energy savings

**Electric Machines and Drives** Ned Mohan, 2012-04-13 This book is part of a three book series Ned Mohan has been a leader in EES education and research for decades as author of the best selling text reference Power Electronics This book emphasizes applications of electric machines and drives that are essential for wind turbines and electric and hybrid electric vehicles The approach taken is unique in the following respects A systems approach where Electric Machines are covered in the context of the overall drives with applications that students can appreciate and get enthusiastic about A fundamental and physics based approach that not only teaches the analysis of electric machines and drives but also prepares students for learning how to control them in a graduate level course Use of the space vector theory that is made easy to understand They are introduced in this book in such a way that students can appreciate their physical basis A unique way to describe induction machines that clearly shows how they go from the motoring mode to the generating mode for example in wind and electric vehicle applications and how they ought to be controlled for the most efficient operation
