Topics in Lipid Chemistry F. D. Gunstone, 1970 **Lipid Handbook** Frank D. Gunstone, John L. Harwood, Fred B. Padley, 1986-08-28 Lipids James F. Mead, 1986-03-31 Abstract An advanced college text for graduate and postdoctoral students in health sciences covers most aspects of lipids ranging from their physical and chemical properties through their biochemical and metabolic pathways to their role in nutrition The 19 text chapters cover the definition and solubility of lipids fatty acid characteristics and properties structures crystals films and soaps peroxidation catabolism and biosynthesis and essential unsaturated fatty acids prostaglandins thromboxanes and prostacyclin eicosanoids the in vivo digestion absorption transport and metabolism of lipids triacylglycerol metabolism and adipose tissue metabolism the biosynthesis of cholesterol and related lipids the structure and properties of amphiphilic lipids phosphoglyceride and sphingolipid metabolism and the nutritional value of lipids References are given at the end of each chapter and numerous structures reactions and mechanisms are presented throughout the text **Lipid Synthesis and Manufacture** F. D. Gunstone, 1999 Synthesis is an important chemical activity with new and revised procedures being developed continually Underlying all modern synthetic work is the desire to develop ever simpler methods which do not damage the environment Lipid Synthesis and Manufacture offers a balance of topics drawing on authors best equipped to them Several chapters are devoted to the synthesis and production of fatty acids and closely related derivatives Areas more immediately of interest to those working in the food and oleochemical industries focus on vitamin E other natural antioxidants sugar esters and ethers and food surfactants This is an essential reference **Recent Advances in Chemistry and Technology of Fats and Oils** R. J. Hamilton, 2012-12-06 Since we produced Fats and Oils Chemistry and Technology in 1980 the trend we anticipated to up date the classical texts of oils and fats has manifested itself Bailey s famous textbook has been completely revised and a second edition of Bernardini s work has been produced The present text is an attempt to provide some insight into the current state of the art Chapter 1 discusses the physical properties of oils and fats with special reference to those properties which can be monitored to give an indication of the suitability of fats for chocolate production The physical properties of the fats are often determined by the order in which the fatty acids are attached to the glyceride molecule Ram Bhati in the last article he wrote before his death showed how mass spectrometry and chemical methods could be used to determine the sequence of fatty acids Ram s essentially practical approach to the problem is exemplified by the section dealing with the experimental details of the techniques Chapter 3 outlines some of the problems which can arise in industry when the lipid part of a foodstuff undergoes oxidation whilst in Chapter 4 Patterson describes the major technique hydrogenation which is used to circumvent the problems caused by oxidation of the unsaturated fatty acids In Chapter 4 the essentials of the theory are given to enable the reader to appreciate the design features of the apparatus Chapter 5 deals with the analysis mainly chromatographic of lipids *Lipid Biochemistry* J.L. Harwood, M.I. Gurr, 2013-04-17 Lipids can usually be extracted easily from tissues by making use of their hydrophobic characteristics However such extractions yield a complex mixture of different lipid classes which have to

be purified further for quantitative analysis. Moreover, the crude lipid extract will be contaminated by other hydrophobic molecules e.g. by intrinsic membrane proteins. Of the various types of separation processes, thin layer and column chromatography are most useful for intact lipids. High performance liquid chromatography (HPLC) is also rapidly becoming more popular, especially for the fractionation of molecular species of a given lipid class. The most powerful tool for quantitation of the majority of lipids is gas liquid chromatography (GLC). The method is very sensitive and if adapted with capillary columns can provide information with regard to such subtle features as the position or configuration of substitutions along acyl chains. By coupling GLC or HPLC to a radioactivity detector, then the techniques are also very useful for metabolic measurements. Although research laboratories use generally sophisticated analytical methods such as GLC to analyse and quantify lipid samples, chemical derivatizations are often used in hospitals. For these methods, the lipid samples are derivatized to yield a product which can be measured simply and accurately, usually by colour. Thus, total triacylglycerol, cholesterol or phospholipid phosphorus can be quantitated conveniently without bothering with the extra information of molecular species etc, which might be determined by more thorough analyses.

Lipid Biochemistry: An Introduction, M. I. Gurr, 2012-12-06.

In the preface to the Second edition, we made a prediction that many exciting developments would take place in the coming years that would change the face of a new edition. This has indeed been the case, and the current edition reflects these new advances. Our picture of the structure of the fatty acid synthetase has changed dramatically, bringing a new concept in enzymology: the multicatalytic polypeptide chain. This new knowledge owes much to the exploitation of genetic mutants, the use of which is undoubtedly going to extend into many other areas of lipid biochemistry. An understanding of the control of lipid metabolism has also advanced considerably during the last decade, and we have tried to reflect that here, although it will be some years before a truly integrated picture can be obtained. For this reason, we have continued to deal with the control of particular aspects of lipid metabolism: fatty acids, triacylglycerols, lipoprotein, in the specific chapters, but we can foresee the time when a chapter on the overall integration of lipid metabolism will be appropriate and feasible. As a particular example, the exciting new concepts of the control of cholesterol metabolism in specific tissues via the interaction of low density lipoproteins with cell surface receptors have been described in Chapter 6.

Food Lipids, Fereidoon Shahidi, Hugo Weenen, American Chemical Society, Division of Agricultural and Food Chemistry, 2006.

Chemistry, Flavor and Texture of Lipid Containing Foods discusses the chemistry and functionality of fat in food sensory perception and the underlying physicochemical and physiological properties and processes. Fats and oils profoundly affect our sensory perception and appreciation of foods. Fats and oils serve as a source of many flavor compounds, most of which result from oxidation of unsaturated fatty acids. The nose perceives these flavor molecules by chemoreception, and the texture of foods are related to

their physicochemical characteristics and structure and thus are perceived by mechanoreception. However, the structural and physicochemical characteristics of fats and oils also strongly influence flavor release. Furthermore, recent studies suggest perception of fats and oils may also be mediated by chemoreception in the oral cavity. While fats and oils have beneficial ingredients because of their energy density, we should minimize their intake because obesity is a serious health risk. Additionally, some types of fat have been found to contribute to arteriosclerosis. Therefore, the food industry is particularly interested in developing foods that have the sensory and hedonic functionality with less fat.
