Westerterp,2012-12-13 Energy balance can be maintained by adapting energy intake to changes in energy expenditure and vice versa where short term changes in energy expenditure are mainly caused by physical activity Questions are whether physical activity is affected by over and under eating is intake affected by an increase or a decrease in physical activity and does overweight affect physical activity Presented evidence is largely based on studies where physical activity is quantified with doubly labeled water Overeating does not affect physical activity while under eating decreases habitual or voluntary physical activity Thus it is easier to gain weight than to lose weight An exercise induced increase in energy requirement is compensated by intake while a change to a more sedentary routine does not induce an equivalent reduction of intake and generally results in weight gain Overweight and obese subjects have similar activity energy expenditures than lean people despite they move less There are two options to reverse the general population trend for an increasing body weight reducing intake or increasing physical activity Based on the results presented eating less is most effective for preventing weight gain despite a potential negative effect on physical activity when reaching a negative energy balance

**Journal of Agricultural Research** ,1925 Taste and Healthy Eating in the Context of Well-being, Sustainability and 21st Century Food Science Hisayuki Uneyama,Ken Iwatsuki,Nobuyuki Sakai, Keiko Yasumatsu,2025-04-24 In the Anthropocene the global food system affects the geosystem and its biosphere and thus it is important for us to reconsider our eating style s and develop new and sustainable food systems This is particularly crucial since we are facing the risk of morbidity and mortality result from unhealthy diets In 2019 the EAT Lancet commission offered a new food standard that gratifies both health and environmental sustainability calling it the planetary health diet It is necessary for us to understand the sensory characteristics of the planetary health diet and how we humans select consume and develop foods and beverages to satisfy the standards of this new dietary approach These understandings add more fuel to promote the achievements of Sustainable Development Goals and of the planetary health diet This Research Topic aims to reveal the neural and biological mechanisms underlying the perception and selection of the planetary health diet Currently we have only little knowledge about taste and flavor perception so we do not know what sensory characteristics of foods are liked Also we do not know the mechanisms involved in selecting certain foods For example we know that excessive salt intake induces hypertension and or obesity but often we do not select low salt foods even when suffering from the high blood pressure We also know that animal

models e g mice rats consume more of diets that impart a good taste for them As humans however we do not always eat so much of foods that may taste good for us and may consume foods or beverages that are not so enjoyable for us Thus a multidisciplinary approach is needed to challenge these topics     *Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations for 2001: Food, nutrition, and consumer services ... rural development* United States.
