Tetrapyrroles Martin Warren, Alison Smith, 2009-12-21 Excluding the biological polymers proteins lipids and nucleic acids modified tetrapyrroles are the biological molecules that have had the greatest impact on the evolution of life over the past 4 billion years They are involved in a wide variety of fundamental processes that underpin central primary metabolism in all kingdoms of life from photosynthesis to methanogenesis Moreover they bring colour into the world and it is for this reason that these compounds have been appropriately dubbed the pigments of life To understand how and why these molecules have been so universally integrated into the life processes one has to appreciate the chemical properties of the tetrapyrrole scaffold and where appropriate the chemical characteristics of the centrally chelated metal ion This book addresses why these molecules are employed in Nature how they are made and what happens to them after they have finished their usefulness

Nitrosyl Complexes in Inorganic Chemistry, Biochemistry and Medicine II D. Michael P. Mingos, 2014-06-19 The series Structure and Bonding publishes critical reviews on topics of research concerned with chemical structure and bonding The scope of the series spans the entire Periodic Table and addresses structure and bonding issues associated with all of the elements It also focuses attention on new and developing areas of modern structural and theoretical chemistry such as nanostructures molecular electronics designed molecular solids surfaces metal clusters and supramolecular structures Physical and spectroscopic techniques used to determine examine and model structures fall within the purview of Structure and Bonding to the extent that the focus is on the scientific results obtained and not on specialist information concerning the techniques themselves Issues associated with the development of bonding models and generalizations that illuminate the reactivity pathways and rates of chemical processes are also relevant The individual volumes in the series are thematic The goal of each volume is to give the reader whether at a university or in industry a comprehensive overview of an area where new insights are emerging that are of interest to a larger scientific audience Thus each review within the volume critically surveys one aspect of that topic and

places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years should be presented using selected examples to illustrate the principles discussed A description of the physical basis of the experimental techniques that have been used to provide the primary data may also be appropriate if it has not been covered in detail elsewhere The coverage need not be exhaustive in data but should rather be conceptual concentrating on the new principles being developed that will allow the reader who is not a specialist in the area covered to understand the data presented Discussion of possible future research directions in the area is welcomed Review articles for the individual volumes are invited by the volume editors Readership research scientists at universities or in industry graduate students Special offer for all customers who have a standing order to the print version of Structure and Bonding we offer free access to the electronic volumes of the Series published in the current year via SpringerLink **Fe Radical** Randy

McKean,2019-07-19 **Electron Paramagnetic Resonance** Bruce C Gilbert,2008-12-19 Electron Paramagnetic Resonance EPR Volume 21 highlights major developments in this area with results being set into the context of earlier work and presented as a set of critical yet coherent overviews The topics covered describe contrasting types of application ranging from biological areas such as EPR studies of free radical reactions in biology and medically related systems to experimental developments and applications involving EPR imaging the use of very high fields and time resolved methods Critical and up to the minute reviews of advances involving the design of spin traps advances in spin labelling paramagnetic centres on solid surfaces exchange coupled oligomers metalloproteins and radicals in flavoenzymes are also included As EPR continues to find new applications in virtually all areas of modern science including physics chemistry biology and materials science this series caters not only for experts in the field but also those wishing to gain a general overview of EPR applications in a given area Volume 21 cover literature published during 2005 and 2006 *Free Radicals in Synthesis and Biology* F.

Minisci,2012-12-06 Free radical reactions have been for long time the domain of the physical chemists and the basic chemical industry polymerization of vinyl monomers oxidation by molecular oxygen chlorination of methane etc where the use of simple molecules and the possibility of partial conversions without heavy problems of product separations makes less dramatic the aspects of regio and chemoselectivity As synonym of unselectivity free radical reactions were considered of poor use in the synthesis of fine chemicals or sophisticated molecules where a high selectivity is an essential condition for the success or in the involvement of biological processes Within the last 15 years however an authentic explosion of synthetic applications of free radical reactions occurred they have gained a remarkable position among the selective methods of synthesis At the same time the great importance of free radical reactions in fundamental biological processes and in the metabolism of drugs has been recognized Thus a specialized meeting on these topics was generally felt appropriate I had the honour and the onus to organize this workshop because for more than 30 years I have been involved in the research of free radical reactions Thanks to a generous grant from NATO Scientific Affairs Division and the financial support of CNR and
