Searl, 2016-03-22 In 1973 a seminar was held by Resources for the Future to bring together the new and growing community of scholars researching into the general field of energy modelling Originally published in the same year this report gathers together all of the papers presented at that seminar in order to further spread the results of these studies with those who were unable to attend The papers cover a full range of techniques used for energy modelling whilst commenting on current government and industry models This title will be of interest to students of Environmental Studies      *Energy and Household Expenditure Patterns* Thomas J. Lareau, Joel Darmstadter, 2016-03-17 Originally published in 1983 *Energy and Household Expenditure Patterns* claimed that two thirds of energy consumption in the United States came from households This study aimed to estimate the expected changes in household activities and how this would affect energy consumption in the country as a whole Also discussed are implications of direct energy purchases and spending on energy goods in households as well as predicting the growth in energy consumption leading up to the year 2000 This title will be of interest to students of Environmental Studies and Economics      Fossil Energy Update, 1982      *Economic Theory of Natural Resources* XY. Econometric General Equilibrium Modeling presents an econometric approach to general equilibrium modeling of the impact of economic policies. Earlier approaches were based on the calibration of general equilibrium models to a single data point. The obvious disadvantage of calibration is that it requires highly restrictive assumptions about technology and preferences such as fixed input output coefficients. These assumptions are contradicted by the massive evidence of energy conservation in response to higher world energy prices beginning in 1973. The econometric approach to general equilibrium modeling successfully freed economic policy analysis from the straitjacket imposed by calibration. As a consequence of changes in energy prices and new environmental policies, a wealth of historical experience has accumulated over the past two decades. Interpreted within the framework of the neoclassical theory of economic growth, this experience provides essential guidelines for future policy formation. Volume 2, *Energy, the Environment and Economic Growth*, presents a new econometric general equilibrium model of the United States that captures the dynamic mechanisms underlying growth trends and responses to energy and environmental policies. Jorgenson uses the model to analyze the impacts of environmental regulations on US economic growth and tax policies for controlling US emissions of carbon dioxide. Projections of Demand for Waterborne Transportation, Ohio River Basin, 1980, 1990, 2000, 2020, 2040: Coal and coke, 1980

 United States. Energy Research and Development Administration. Technical Information Center, 1976 Analyzing Demand Behavior Douglas R. Bohi, 2013-11-26. First Published in 2011. This title takes econometric studies as data; it examines their assumptions, investigates their methodologies, contrasts the data sets they use, and compares their results. By informing users what they can and cannot expect from researchers, it can sharpen the criteria that are used to commission such studies and judge their results. By examining an array of studies dealing with the same or related phenomena, Bohi can analyse the ways in which decisions made by researchers affect their results. All while considering inferences surrounding the role of econometric demand estimation in formulating policy and understanding demand behavior. *Changing by Degrees*, 1991

*Growth: Econometric general equilibrium modeling* Dale W. Jorgenson, 1998. As a consequence of changes in energy prices and new environmental policies, a historical experience has accumulated over the past two decades. Interpreted within the framework of the neoclassical theory of economic growth, this experience provides essential guidelines for future policy formation. A Dynamic Model of the US Energy System John P. Weyant, 2017-09-05. Originally published in 1984, this book develops a quantitative model designed for use in the evaluation of the relative merits of alternative energy R D programmes. It is used to compare the merits of major energy technology R D programmes during the 1970s in the USA: Liquid metal fast breeder reactors, synthetic fuels derived from coal and oil shale, and improved efficiency in end use technologies. The benefits/disadvantages are analyzed in terms of economics, security, and the environment. Although published some years ago, the economic benefit assessed is in terms of the impact that commercialization of a particular

energy technology would have on the total 60 year cost of the US energy supply system The security benefit is measured in terms of the reduction of crude oil imports and the environmental factors are measured here by the total tonnage of coal and oil shale that is extracted each year All of these issues continue to be relevant today Economic Modelling in the OECD Countries Homa Motamen-Scobie,2012-12-06 among the 159 member countries of the United Nations Organization which are treated as country units while smaller countries are grouped together in regions The number of equations used is approximately 13 700 while the number of software steps for computation is approximately 100000 Computation including tabulation can nevertheless be performed very rapidly and only about 20 minutes is required to make forecasts from the present up to the year 2000 The FUGI model is at present being used by the Projections and Perspectives Studies Branch Department of International Economic and Social Affairs of the United Nations for simulations of United Nations medium and long term international development strategies while the Project LINK model is being used for short term forecasts Onishi 1985 Stimulated by our latest joint research with the United Nations University on a global early warning system for displaced persons we have felt the need for our FUGI model to go beyond its present capacities centred on an economic model in the rather traditional restricted sense of the term and to develop into a model that can in the future analyse global problematiques or global complexes of symptoms and complicated questions including various types of environmental problems and the sorts of displaced persons issues to which we are now directing our attention We are thus expanding the scope of our fifth generation FUGI model presently under development to deal with such issues **Changing by degrees : steps to reduce greenhouse gases. ,1991**
