

# SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using elephants as an example – a forest-type found across much of southern Africa.

1. **Food source** – Elephants are omnivores, feeding on plants, fruits, seeds, bark, roots, leaves, flowers, and insects. They are keystone species, maintaining balance and supporting many other organisms. For example, elephant waste is used by humans for fertilizer. Elephants also help spread seeds across their feeding grounds, helping regenerate the land of forests and other ecosystems.

2. **Waste disposal** – Elephants produce lots of waste, which helps spread organic material across the landscape, helping disperse seeds and nutrients. For example, elephant droppings contain millions of bacteria, helping generate the variety of chemicals like acids and bases.

3. **Pest control** – Elephants have a healthy diet of predators that keep pest populations under control. For example, elephants eat termites and germs can reduce them. Among their predators are lions, leopards, and crocodiles, which hunt the elephant for meat and fat.

4. **Air & Water** – Elephants drink more than most animals, creating water holes that animals need to survive. When they urinate in their holes, sand and silt are carried on the tail and legs. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Elephants' body movement is very efficient at moving sand and silt around.

5. **Food & Fertilizer** – Elephants are one of the few keystone species that can support many other species. This is the benefit of their behaviour. All species in the world depend on the elephant and humans for plants and animals and they eat different foods for different times (e.g. seeds and fruit).

6. **Waste disposal** – Elephants produce lots of waste, which helps spread organic material across the landscape, helping disperse seeds and nutrients. Elephants also help regenerate the land of forests and other ecosystems.

7. **Pest control** – Elephants have a healthy diet of predators that keep pest populations under control. For example, elephants eat termites and germs can reduce them. Among their predators are lions, leopards, and crocodiles, which hunt the elephant for meat and fat.

8. **Seed dispersal** – Elephants eat everything, with many different species contributing to seedless reproduction. For example, elephants eat acacia and baobab. Seeds, unlike most other seeds, don't have a hard shell to protect and disperse against insects and smaller animals through their droppings.

Ecosystem Management Mark S. Boyce,Alan W. Haney,1997-01-01 Until recently natural resource management of such commodities as timber and wildlife was driven largely by the desire to exploit these resources During the past three decades however ecologists have warned that this approach to natural resource management could have unforeseen consequences because it ignored how ecosystems function within the landscape Federal agencies that oversee forest and wildlife resources have begun to implement different schemes of ecosystem management schemes that vary enormously among agencies Contributors to this volume leading experts who are agency personnel as well as researchers now clarify the key elements of sound ecosystem management and offer prescriptions for implementing them The authors discuss definitions of ecosystem management sustainability of ecological systems landscape ecology resource management at different scales and in an ecosystem context new advances in computer technology that facilitate classification schemes for ecosystems ecosystem restoration biological diversity and public concerns Throughout the experts agree that management practices must be sustainable that production of commodities such amenities as recreation and aesthetics and biodiversity must not be allowed to decline over time    *Ecosystem Management* Richard Sheppard Mitchell,Charles J. *Serpentine Geoecology of Western North America* Earl B. Alexander,Robert G. Coleman,Todd Keeler-Wolfe,Susan P. Harrison,2006-11-02 This book is about geology soils and plant communities in serpentine landscapes of western North America Aspects of the interaction of geology and soils reveal a fascinating symbiosis relating the structure composition and distribution of plant communities The plants that survive are a unique group There are some entire genera or even families of plants that are common throughout California that are poorly represented on serpentine while other genera are more diverse on serpentine than on other soils Serpentine rocks have dramatic effects on the vegetation that grows on them Many common plants cannot grow on serpentine soils leaving distinctive suites of plants to occupy serpentine habitats The floristic diversity associated with serpentine soils formed above ultramafic rocks is surprising considering that these soils are toxic to many plants Serpentine barrens of California often look like moonscapes but here we find numerous species of plants of low biomass that produce a richness of species rarely found in the world      **Savannas, Barrens, and Rock Outcrop Plant Communities of North America** Roger C.
