Input-Output Economics Wassily Leontief, 1986-03-27 This collection of writings provides the only comprehensive introduction to the input output model for which Leontief was awarded the Nobel Prize in 1973 The structural approach to economics developed by Leontief and known as input output analysis paved the way for the transformation of economics into a truly empirical discipline that could utilize modern data processing technology This thoroughly revised second edition includes twenty essays twelve of which are new to this edition that reflect the past developments and the present state of the field Beginning with an introductory chapter the book leads the reader into an understanding of the input output approach not only as formal theory but also as a research strategy and powerful tool for dealing with a complex modern economy

The Economics of Input-Output Analysis Thijs ten Raa, 2006-01-19 Input output analysis is the main tool of applied equilibrium analysis This textbook provides a systematic survey of the most recent developments in input output analysis and their applications helping us to examine questions such as which industries are competitive What are the multiplier effects of an investment program How do environmental restrictions impact on prices Linear programming and national accounting are introduced and used to resolve issues such as the choice of technique the comparative advantage of a national economy its efficiency and dynamic performance Technological and environmental spillovers are analysed both at the national level between industries and the international level the measurement of globalisation effects The book is self contained but assumes some familiarity with calculus matrix algebra and the microeconomic principle of optimizing behaviour Exercises and review questions are included at the end of each chapter and solutions at the end of the book

M. C. de Boer, 2014-03-12 1 1 Preliminary remarks Input output analysis is one of the most extensively used tools of economic science It has been introduced by Leontief 1941 who assumed that inputs into a production process of a particular sector of economic activity is a constant fraction of the output of that process in physical

terms National account statisticians however record the inputs and outputs of sectors of economic activity in money flows. If those flows were evaluated at constant prices pertaining to a certain base year they could represent the physical amounts Leontief dealt with. Then the Leontief assumption turns into constancy of ratios of volumes of inputs to volumes of output. For an overview of traditional input output analysis we refer to section 4.1.1. In practice however input output tables in volumes are seldom available since as a rule they are expressed in monetary values i.e. evaluated at current prices. In that case one generally assumes that the ratios between inputs in value terms and outputs in value terms are constant. In appendix B to chapter 4 we prove that the two variants described above can be couched in terms of the neo classical theory of costs subject to a production function.

Input-output and Regional Economics Harry W. Richardson, 1972

Economic Interdependence and Innovative Activity Christian DeBresson, Esben Sloth Andersen, 1996. Their central thesis is that innovative outputs emerge out of increased social interactions and division of labour through co-operative networks. An authoritative theoretical introduction and some thought provoking conclusions have been prepared by Christian DeBresson.

Input-Output Analysis and the Structure of Income Distribution K. Miyazawa, 2012-12-06. The purpose of this study is in keeping with the shift in concern over the economic problems of growth to those of income distribution in recent years. Income distribution problems may be analyzed by not only the traditional procedures but also by some extensions of the input output technique as I shall demonstrate in this volume of the Lecture Notes. Some fruitful results are obtained by applying the extended input output technique to income analysis as well as to output analysis. This volume consists of three parts. These parts may be viewed along two veins with some overlapping unavoidable. 1. Parts One and Two contain extensions of the input output analysis and 2. Parts One and Three contain studies of the effects of the structure of income distribution on some other economic relationships. First as an extension of the input output analysis we present a synthesis of the Leontief interindustry matrix multiplier and the Keynesian income multiplier in disaggregated form and introduce a new concept which may be called the Interrelational Income Multiplier as a matrix. It is designed to analyze the interrelationships among various income groups in the process of income formation through the medium of industrial production activity. Although this multi sector multiplier follows from Leontief's interindustry matrix multiplier it is formulated by the inclusion of the income generation process which is omitted in the usual input output open model and by projecting the multiplier process into not only the output determination side but also into the income determination side.

Input-output Analysis M. Giaschini, 1988-06. The twenty two chapters included in this book were written by as many scholars working independently of each other in different countries. They present nevertheless a well integrated picture of systematic advance in the field of input output analysis on the broad front stretching from formal mathematical modelling through construction of large specialized databases to detailed empirical inquiry and concrete examples of practical applications. While reflecting a great variety of individual interests and working styles these contributions taken together

provide evidence of what might appear to be co-ordinated efforts. This coherence has not been brought about by the central guidance so typical of modern large-scale research. It simply reflects the internal discipline and cohesiveness of a particular methodological approach. In input-output analysis, empirical inquiry and theoretical model building have to be carried out hand in hand. If the aim of the investigation is to provide concrete, detailed explanation of observed reality, building an elaborate mathematical model makes little sense without an appropriate database. The language and the terminology used in the construction of that database must however be exactly the same as that employed in the formulation of the theoretical model. The same specifications and definitions must of course be adhered to after the theoretical computations have been completed in the interpretation of the numerical results.

Essays in Economics Wassily Leontief, 1951. This work comprises the major papers of this extraordinary Nobel Laureate in economics. The common concern of the papers included in this volume is economic theory, its structure, uses and abuses. As the late Harry G. Johnson said, 'No one reading this volume can fail to be struck by the depth of scholarship. Professor Leontief is capable of deploying and the profundity of his understanding of methodological problems of economic theory and his critique of the work of other economists.'

Chinese Economic Planning and Input-output Analysis Karen R. Polenske, Xikang Chen, 1991. Since its beginning in China in the 1960s, input-output analysis has expanded rapidly in terms of both theoretical developments and empirical applications. The scarcity of data coming out of China and the limited access to it makes the three major input-output tables published here for the first time in English even more valuable. This study will have special significance for economists and planners using the input-output system of analysis.
