

benefits are single estimates applied across the board to all sites. Problems of water quality are ignored because of insufficient information concerning the relation of water quality to hydrology. Various rates and methods are used to study sensitivity of the design to the discount factor. Results are compared with the final Corps of Engineers design for the basins to show that a very few simulation runs resulted in a design comparable to that derived by standard methods. The relation of flood damages to policy decisions is commented on only in passing, and no new alternatives are considered.

The concluding remarks concerning mechanical details will be of much interest to all who are interested in undertaking simulation studies. Despite the many simplifying assumptions, 80 percent of the memory capacity of the IBM 7094 was used in coding alone. Estimates of computer-run time are given. The interplay of programmer and analyst is described, and the desirability of combining the two skills in one individual is stressed.

As computers become larger and faster, simulation studies will be more common in water-resources design. For those who are on the periphery of the field, or who are involved in simulation for the first time, this book will be helpful. For those teachers who wish to expose their classes to the latest concepts in water-resource system design it will be a good supplementary text.

A Quick Introduction

The task of a book with a title such as that of **Electronics for Experimenters in Chemistry, Physics and Biology** by Leon F. Phillips (Wiley, New York, 1966, 280 pp., illus. Paper, \$3.95) is to provide a balanced account of electronics which is both detailed enough to help the reader see the inner workings of electronics and fast-moving enough so that he does not get lost in these details. The proper balance depends on the outlook and background of the reader, so there is plenty of room for books in this field. Phillips' book is, in his words, "a more or less pocket-sized account," and in reading it I was constantly surprised at

how much progress was made on each page and in each section. Many important results are quickly derived by simple calculus, and many good comments of a practical nature are made throughout the book. The order of presentation of topics is not surprising, starting with simple network theory and properties of vacuum tubes and transistors, and progressing through amplifiers, feedback, and noise to a final chapter in which some complex systems are described. There are sections on construction techniques and troubleshooting which will be valuable to many graduate students. I wish, however, that the author had explicitly mentioned reduction of electric shock hazard when discussing construction techniques.

The fast pace probably precludes learning electronics from this book alone, or even in conjunction with a normal set of lectures of a few hours a week, but there are lists of references which provide the student with a starting place in the literature, and the book should be valuable as a guide in a self-study program.

Model Science Teacher Preparation Programs Jon Pedersen, Tetsuo Isozaki, Toshihide Hirano, 2017-02-01 This volume will focus on a much needed comparison of science teacher preparation from around the world In recent times last 5 years much has been written and communicated both in the popular press and within the annals of research oriented publications about the performance of students internationally in math and science Although not a new discussion or debate many countries are held as exemplars in how they educate their youth and subsequently how they educate their teachers Given this situation and given the fact that there is ample evidence to show that some countries' youth perform better on tests such as the Program for International Student Assessment PISA and we know that teachers significantly contribute to the performance of students it is time that we look at the specific attributes of teacher preparation worldwide Although this volume will not look at every country that is in the comparator group for PISA and other measures we have contacted over 18 potential authors in the same number of countries in which there is ample evidence to show successes regarding student performance and quality teacher preparation programs The intent of the book is not just to report on the success of each nation Rather the intent is to ask authors to take a critical look at the process by which science teachers are educated and share with the reader both the positive and negative aspects of such preparation programs For all 15 contributed chapters the editors have analyzed each and from this constructed from the data an analysis and report in a final chapter on the exemplary qualities from various nations and make specific recommendations regarding science teacher preparation for the global community **Science**
