

A stylized landscape illustration at the top of the cover. It shows a blue river flowing from the right towards the center, bordered by brown rocks. In the background, there are green rolling hills and three green trees. The sky is a solid dark green. The foreground is a large, stylized shape representing the Earth's crust, with a brown upper layer and a yellow-orange lower layer.

Elementary Geology

Sir Charles Lyell

Elementary Geology:

A Manual of Elementary Geology: The Ancient Changes of the Earth and its Inhabitants as Illustrated by Geological Monuments Sir Charles Lyell, 1854-01-01 In the preliminary chapters of *The Principles of Geology* in the first and subsequent editions I have considered the question how far the changes of the earth's crust in past times confirm or invalidate the popular hypothesis of a gradual improvement in the habitable condition of the planet accompanied by a contemporaneous development and progression in organic life It had long been a favourite theory that in the earlier ages to which we can carry back our geological researches the earth was shaken by more frequent and terrible earthquakes than now and that there was no certainty nor stability in the order of the natural world A few sea weeds and zoophytes or plants and animals of the simplest organization were alone capable of existing in a state of things so unfixed and unstable But in proportion as the conditions of existence improved and great convulsions and catastrophes became rarer and more partial flowering plants were added to the cryptogamic class and by the introduction of more and more perfect species a varied and complex flora was at last established In like manner in the animal kingdom the zoophyte the brachiopod the cephalopod the fish the reptile the bird and the warm blooded quadruped made their entrance into the earth one after the other until finally after the close of the tertiary period came the quadrumanous mammalia most nearly resembling man in outward form and internal structure and followed soon afterwards if not accompanied at first by the human race itself The objections which in 1830 I urged against this doctrine in so far as relates to the passage of the earth from a chaotic to a more settled condition have since been embraced by a large and steadily increasing school of geologists and in reference to the animate world it will be seen on comparing the present state of our knowledge with that which we possessed twenty years ago how fully I was justified in declaring the insufficiency of the data on which such bold generalizations respecting progressive development were based Speaking of the absence from the tertiary formations of fossil Quadrumana I observed in 1830 that we had no right to expect to have detected any remains of tribes which live in trees until we knew more of those quadrupeds which frequent marshes rivers and the borders of lakes such being usually first met with in a fossil state I also added if we are led to infer from the presence of crocodiles and turtles in the London clay and from the cocoa nuts and spices found in the isle of Sheppey that at the period when our older tertiary strata were formed the climate was hot enough for the Quadrumana we nevertheless could not hope to discover any of their skeletons until we had made considerable progress in ascertaining what were the contemporary Pachydermata and not one of these has been discovered as yet in any strata of this epoch in England

Elementary Geology Edward Hitchcock, Charles Henry Hitchcock, 1866 **A Manual of Elementary Geology** Charles Lyell, 2017-09-15 Excerpt from A Manual of Elementary Geology Or the Ancient Changes of the Earth and Its Inhabitants He was soon informed by Mr Logan at that time engaged in the geological survey of Canada that the white sandstone above Montreal was really much older than the Old Red or Devonian It had in fact been ascertained many years before by the State

surveyors of New York who called it the Potsdam to lie at the base of the whole Silurian series As such it had been pointed out to me in 1841 in the valley of the Mohawk by Mr James Hall and its position was correctly described by Mr Emmons on the borders of Lake Champlain where I examined it in 1842 It has there the character of a shallow water deposit ripple marked throughout a considerable thickness and full of a species of Lingula The at valves of this shell of a dark color are so numerous and so arranged in horizontal layers as to play the part of mica causing the rock to divide into laminae as in some micaceous sandstones About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works ELEMENTARY GEOLOGY (CLASSIC REPRINT).
