Superintendent of Documents,1933      **Rhumb Lines and Map Wars** Mark Monmonier,2010-11-15 In Rhumb Lines and Map Wars Mark Monmonier offers an insightful richly illustrated account of the controversies surrounding Flemish cartographer Gerard Mercator s legacy He takes us back to 1569 when Mercator announced a clever method of portraying the earth on a flat surface creating the first projection to take into account the

earth's roundness As Monmonier shows mariners benefited most from Mercator's projection which allowed for easy navigation of the high seas with rhumb lines clear cut routes with a constant compass bearing for true direction But the projection's popularity among nineteenth century sailors led to its overuse often in inappropriate non navigational ways for wall maps world atlases and geopolitical propaganda Because it distorts the proportionate size of countries the Mercator map was criticized for inflating Europe and North America in a promotion of colonialism In 1974 German historian Arno Peters proffered his own map on which countries were ostensibly drawn in true proportion to one another In the ensuing map wars of the 1970s and 1980s these dueling projections vied for public support with varying degrees of success Widely acclaimed for his accessible intelligent books on maps and mapping Monmonier here examines the uses and limitations of one of cartography's most significant innovations With informed skepticism he offers insightful interpretations of why well intentioned clerics and development advocates rallied around the Peters projection which flagrantly distorted the shape of Third World nations why journalists covering the controversy ignored alternative world maps and other key issues and how a few postmodern writers defended the Peters worldview with a self serving overstatement of the power of maps Rhumb Lines and Map Wars is vintage Monmonier historically rich beautifully written and fully engaged with the issues of our time

Department of Printed Books,1927      Cartographic Science Donald Fenna,2006-10-25 Geographic books routinely introduce map projections without providing mathematical explanations of projections and few delve into complex mathematical development or cover the breadth of projections From basic projecting to advanced transformations *Cartographic Science A Compendium of Map Projections with Derivations* is a comprehensive reference that offers an explanation of the science of cartography The book is a compilation of more than a hundred map projections from classic conics to contemporary transformations using complex variables Starting from widely described geometric projecting onto flat paper cylinder and cone and then progressing through several layers of mathematics to reach modern projections the author maximizes the application of one layer of complex mathematics before continuing on to the next He also supplies numerous one page tutorials that review terms and methodologies helping minimize the challenges of unfamiliar mathematical territory Divided into four parts the first section examines the shape and size of the Earth then proceeds to investigate the means for relating the curved surface to a flat surface and addresses scaling It goes on to cover pertinent principles of projection including literal projecting true but synthetic projections secantal projections pseudocylindrical projections and pseudoconical projections as well as the other variants of more serious projections The book concludes by

looking at factors influencing Mean Sea Level and notes the cartographic aspects of current developments Cartographic Science A Compendium of Map Projections with Derivations explains the mathematical development for a large range of projections within a framework of the different cartographic methodologies This carefully paced book covers more projections with gentle and progressive immersion in the mathematics involved than any other book of its kind
