Electronic Noses And Sensors For The Detection Of Explosives:

Electronic Noses & Sensors for the Detection of Explosives J. Gardner, Jehuda Yinon, 2004-08-17 This book examines both the potential application of electronic nose technology and the current state of development of chemical sensors for the detection of vapours from explosives such as those used in landmines The two fields have developed somewhat in parallel over the past decade and so one of the purposes of this workshop on which the book is based was to bring together scientists from the two fields in order to challenge the two communities and mutually stimulate both fields It begins with a review of the basic principles of an electronic nose and explores possible ways in which the detection limit of conventional electronic nose technology can be reduced to the level required for the trace levels observed for many explosive materials Next are reviews of the use of several different types of solid state chemical sensors polymer based sensors i e chemiluminescent fluorescent and optical to detect explosive materials metal oxide semiconducting resistive sensors and then electrochemical sensors Next different pattern recognition techniques are presented to enhance the performance of chemical sensors Then biological systems are considered as a possible blue print for chemical sensing The biology can be employed either to understand the way insects locate odorant sources or to understand the signal processing neural pathways Next is a discussion of some of the new types of electronic noses namely a fast GC column with a SAW detector and a micromechanical sensor Finally the important issues of sampling technologies and the design of the microfluidic systems are considered In particular the use of pre concentrators and solid phase micro extractors to boost the vapour concentration before it is introduced to the chemical sensor or electronic nose

Detection of Explosives and Landmines Hiltmar Schubert, Andrey Kuznetsov, 2012-12-06 This ARW is the third NATO sponsored workshop on Explosives Detection and Humanitarian Demining The previous events were Detection and Destruction of Anti Personnel Landmines Moscow 1997 Explosives Detection and Decontamination of the Environment Prague 1997 Over the last decade applied research in Humanitarian Demining has made progress to some extent but according to the tremendous tasks of Demining and the lack of scientific methods for practical detection of explosive devices research activities are still of the same importance than ever before Concerning countermeasures against terrorism the detection of explosives is one of the key factors but the practical applications are not sufficient solved An international exchange of research results are therefore urgent to find out the most promising measures for application The coincidence of this ARW and the terrible disaster of New York and Washington may demonstrate the importance of this task In consequence the explosive device detection technologies can make a major contribution to

collective family and individual security In developed countries these technologies provide a strong deterrent and preventative measure against terrorist threats In less developed regions they can improve individual institutional and state security lessening the insecurity that motivates many terrorists acts The elimination of landmine threats is just one of many ways of achieving this However our attempts to meet the extremely difficult technical challenges posed by landmine and UXO contamination are inevitably leading us to new technological approaches
