Food Biotechnology Mason Sutton & Skylar Barr,2018-11-02 Biotechnology has a long history of use in food production and processing For ten thousand years fermentation a form of biotechnology has been used to produce wine beer and bread Selective breeding of animals such as horses and dogs has been going on for centuries Selective breeding of essential foods such as rice corn and wheat have created thousands of local varieties with improved yield compared to their wild ancestors Wheat that is best for bread is different from wheat that is best for pasta This was accomplished through conventional breeding over many years using traditional methods However such methods were often unpredictable and inefficient resulting in undesirable traits passed along with desirable ones Today through newer biotechnology and genetic engineering scientists use techniques such as recombinant DNA rDNA Scientists by using rDNA can move one gene the inherited instruction for specific traits from one organism to another and omit the undesirable traits This enables food producers to obtain animal and crop improvements in a much more precise controlled and predictable manner The book presents a thorough and accessible account of modern food biotechnology and will make an ideal course book It is useful not only to the undergraduate and postgraduate students but also to the researchers involved in the biological sciences biotechnology and food science and technology

Food Biotechnology—1 R. D. King,2012-12-06 Biotechnology in its many guises has developed very considerably over the last few years We now feel that it is appropriate for the publication of a series of books that discuss the technical aspects of biotechnology specifically as applied to foods and in particular concentrating on new and emerging techniques processes and products Food is without doubt one of the oldest bioindustries however some of the new areas of biotechnology such as diagnostic and health care applications are likely to mature much faster than applications in the food industry Eventually however biotechnology must have a very great impact on a wide scale in the food industry simply because of the size and diversity of the industry and because most food products are substantially natural in origin and are therefore very suitable for processing by biocatalysts Some of the ways in which the food industry is likely to be affected by developments in biotechnology include the following The modification of food components to give products with new and or improved properties for instance high fructose corn syrups and by modifying the functional properties of proteins New methods of assaying food constituents such as immobilized enzyme sensors New processes for the production of foods and food components for instance the use of plant cell cultures for the production of flavours Many of these topics will be described in detail in this series of books
