Regional Trade Agreements and the Multilateral Trading System Rohini Acharya, 2016-09-22 This volume contains a collection of studies examining trade related issues negotiated in regional trade agreements RTAs and how RTAs are related to the WTO's rules. While previous work has focused on subsets of RTAs, these studies are based on what is probably the largest dataset used to date and highlight key issues that have been negotiated in all RTAs notified to the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO). New rules within RTAs are compared to rules agreed upon by WTO members. The extent of their divergences and the potential implications for parties to RTAs as well as for WTO members that are not parties to RTAs are examined. This volume makes an important contribution to the current debate on the role of the WTO in regulating international trade and how WTO rules relate to new rules being developed by RTAs.

*Instance Selection and Construction for Data Mining* Huan Liu, Hiroshi Motoda, 2013-03-09 The ability to analyze and understand massive data sets lags far behind the ability to gather and store the data. To meet this challenge, knowledge discovery and data mining (KDD) is growing rapidly as an emerging field. However, no matter how powerful computers are now or will be in the future, KDD researchers and practitioners must consider how to manage ever growing data, which is ironically due to the extensive use of computers and ease of data collection with computers. Many different approaches have been used to address the data explosion issue, such as algorithm scale up and data reduction. Instance example or tuple selection pertains to methods or algorithms that select or search for a representative portion of data that can fulfill a KDD task as if the whole data is used. Instance selection is directly related to data reduction and becomes increasingly important in many KDD applications due to the need for processing efficiency and/or storage efficiency. One of the major means of instance selection is sampling, whereby a sample is selected for testing and analysis, and randomness is a key element in the process. Instance selection also covers methods that require search. Examples can be found in density estimation, finding the representative instances, data points for a cluster boundary, hunting, finding the critical instances to form boundaries to differentiate data points of different classes, and data squashing, producing weighted new data with equivalent sufficient statistics. Other important issues related to instance selection extend to unwanted precision, focusing, concept drifts, noise, outlier removal, data smoothing, etc. Instance Selection and Construction for Data Mining brings researchers and practitioners together to report new developments and applications, to share hard learned experiences in order to avoid similar pitfalls and to shed light on the future development of instance selection. This volume serves as a comprehensive reference for graduate students, practitioners, and researchers in KDD.
