**The Role of Arthropods in Forest Ecosystems** W.J. Mattson, 2012-12-06 The role of arthropods in forest ecosystems is poorly understood Yet such knowledge may be critical in order to explain fully the fundamental forces that shape the structure and regulate the functioning of such ecosystems There are numerous hypotheses about the roles of various arthropods but few if any of these hypotheses have been rigorously tested Some however have been repeated so often and so widely that they are now accepted by many as unequivocal fact Nothing could be further from the truth Forest arthropods which derive most of their sustenance from plants are usually specially adapted for feeding in one of three subsystems the above ground plant system the soil litter system or the aquatic stream system Plant feeding arthropods in the soil litter and stream systems are primarily saprophous although many consume significant amounts of microorganisms Research on the role of arthropods in each of these three subsystems has historically been provincial Until very recently there has been little effort to collate assimilate and synthesize the plethora of findings in even one of these systems much less all three This Symposium at the 15th International Congress
