Scientific Approaches to Consciousness Jonathan D. Cohen, Jonathan W. Schooler, 2014-04-04 There are many ways to approach the understanding of consciousness Questions about these ways have occupied philosophers and metaphysicians for centuries During the early growth of cognitive science the problem of consciousness remained taboo but an increasing number of studies have either implicitly or explicitly begun to bear on its nature These have been inspired by a number of different different original questions and focus on a variety of different empirical phenomena Thus studies of implicit memory subliminal processing strategic versus automatic processing allocation of attention and differences between information processes in the awake versus dreaming state all share a common assumption of a particular quality or state awokeness awareness alertness namely consciousness that somehow can be distinguished from another type of state or states in which the subject is not aware of the information being processed What distinguishes the cognitive psychological and cognitive neuroscience approach to the

question of consciousness from that of philosophy and metaphysics is scientific methodology a set of tools that permit the empirical study of a phenomenon in an objective and reproducible way Recent developments in both the empirical and theoretical methodologies of these fields have made it possible to begin to study the phenomenon associated with if not directly underlying consciousness in a scientific fashion This volume tries to resolve the difficulties associated with the scientific investigation of consciousness The intent is to explore the extent to which consciousness can be the target of direct scientific inquiry to get on the table some of the relevant work and consider the degree to which this research can help inform our understanding of consciousness It brings together a group of cognitive and neuroscientists to share relevant recent research in the fields of cognitive science and neuroscience and to determine whether any new strategies for the scientific pursuit of this question can be developed A long term goal is the development of a unified understanding of consciousness scientific as well as philosophical perspectives This volume takes the first step toward building the necessary local bridges

Human Movement and Motor Control in the Natural Environment Peter A Federolf, Maurice Mohr, Thorsten Stein, Gert-Jan Pepping, Steven van Andel, Gillian Weir, 2023-06-08 The basic understanding of human movement and control of human movement stems largely from laboratory measurements where human movement can be quantified with high precision and accuracy but where the artificial environment compromises ecological validity A good example for this issue was demonstrated in a recent investigation specifically that the walking gait pattern of healthy individuals in a laboratory changed as a function of how many researchers were present during the experiment Observations like these underscore that study volunteers adapt their behavior to the specific laboratory environment and warrant the question of how well we can transfer our lab based

understanding of gait patterns and the underlying neuromuscular control system to walking during daily living Another research area where lab based movement assessments have led to conflicting findings is the field of sports injury prevention Many neuromuscular training programs have been shown to be effective in reducing the sport injury rate in athletes by 30 50% or more in a variety of different multi directional sports Nevertheless lab based assessments of the same athletes who completed those training programs were often not able to detect improvements in motor control of sport specific movements or a reduction in joint loading two factors thought to be closely linked with sport injury risk This disconnect suggests that lab based assessments of movement and motor control are often poor indicators of player behavior during real game scenarios and may limit our ability to screen athletes for injury risk or monitor their progress in rehabilitation These examples highlight that we should strive for the assessment and investigation of human movement and motor control in natural environments i e where individuals patients athletes or other groups of interest perform explore and interact under real world conditions
