**Equations** Messoud Efendiev, 2018-10-17 This book deals with a systematic study of a dynamical system approach to investigate the symmetrization and stabilization properties of nonnegative solutions of nonlinear elliptic problems in asymptotically symmetric unbounded domains The usage of infinite dimensional dynamical systems methods for elliptic problems in unbounded domains as well as finite dimensional reduction of their dynamics requires new ideas and tools To this end both a trajectory dynamical systems approach and new Liouville type results for the solutions of some class of elliptic equations are used The work also uses symmetry and monotonicity results for nonnegative solutions in order to characterize an asymptotic profile of solutions and compares a pure elliptic partial differential equations approach and a dynamical systems approach The new results obtained will be particularly useful for mathematical biologists *Challenges in Scientific Computing - CISC 2002* Eberhard Baensch, 2012-12-06 The conference Challenges In Scientific Computing CISC 2002 took place from October 2 to 5 2002 The hosting institution was the Weierstrass Institute for Applied Analysis and Stochastics WIAS in Berlin Germany The main purpose of this meeting was to draw together researchers working in the fields of numerical analysis and scientific computing with a common interest in the numerical treatment and the computational solution of systems of nonlinear partial differential equations arising from applications of physical and engineering problems The main focus of the conference was on the problem class of nonlinear transport diffusion reaction systems chief amongst these being the Navier Stokes equations semiconductor device equations and porous media flow problems The emphasis was on unsolved problems challenging open questions from applications and assessing the various numerical methods used to handle them rather than concentrate on accurate results from solved problems Thanks to the participants it was an interesting meeting The presentations stimulated exchanging ideas and lively discussions This proceedings comprises 13 papers from the conference ranging from numerical methods for flow problems multigrid methods semiconductor and microwave simulation solution methods finite element analysis to software aspects This interesting

conference would not have been possible without the help of the staff of the WIAS I thank all participants and all our supporters especially those not onstage for making the conference a success

Numerical Mathematics and Advanced Applications F. Brezzi, A. Buffa, S. Corsaro, A. Murli, 2012-12-06 Scientific computing is a fast growing and fast changing area whose applications to various branches of science engineering medicine economics and others are increasing in number and relevance every day There are two main reasons among others that make scientific computing change so rapidly One is the increasing number of different research areas beginning to make use of numerical simulation from nanotechnology to genomics from computer aided diagnosis and operations in medical applications which involve often complete simulations of parts of the human body to economics and finance Each new application and each new aspect of earlier applications draws heavily on the know how that has been acquired on other problems with similar mathematical features It has to be pointed out that the lofty perspective of mathematics succeeds quite often in finding connections among very different phenomena that turn out in the end to share the same mathematical and numerical structure In turn new applications contribute to the cross fertilization by sending back new interpretations and suggestions which are often useful in more classical applications All this creates a resonance effect that contributes greatly to the growth rate of the whole field

Evolution Inclusions and Variation Inequalities for Earth Data Processing III Mikhail Z. Zgurovsky, Pavlo O. Kasyanov, Oleksiy V. Kapustyan, José Valero, Nina V. **Qualitative Analysis of Nonlinear Elliptic Partial Differential Equations** Vicențiu Rădulescu, 2008 This book

provides a comprehensive introduction to the mathematical theory of nonlinear problems described by elliptic partial differential equations. These equations can be seen as nonlinear versions of the classical Laplace equation and they appear as mathematical models in different branches of physics, chemistry, biology, genetics, and engineering and are also relevant in differential geometry and relativistic physics. Much of the modern theory of such equations is based on the calculus of variations and functional analysis. Concentrating on single valued or multivalued elliptic equations with nonlinearities of various types, the aim of this volume is to obtain sharp existence or nonexistence results as well as decay rates for general classes of solutions. Many technically relevant questions are presented and analyzed in detail. A systematic picture of the most relevant phenomena is obtained for the equations under study, including bifurcation, stability, asymptotic analysis, and optimal regularity of solutions. The method of presentation should appeal to readers with different backgrounds in functional analysis and nonlinear partial differential equations. All chapters include detailed heuristic arguments providing thorough motivation of the study developed later on in the text in relationship with concrete processes arising in applied sciences. A systematic description of the most relevant singular phenomena described in this volume includes existence or nonexistence of solutions, unicity or multiplicity, properties, bifurcation, and asymptotic analysis, and optimal regularity. The book includes an extensive bibliography and a rich index, thus allowing for quick orientation among the vast collection of literature on the mathematical theory of nonlinear phenomena described by elliptic partial differential equations.
