Dear Readers Since the ground breaking Nobel prize crowned work of Heeger MacDiarmid and Shirakawa on molecularly doped polymers and polymers with an alternating bonding structure at the end of the 1970s the academic and industrial research on hydrocarbon based semiconducting materials and devices has made encouraging progress The strengths of semiconducting polymers are currently mainly unfolding in cheap and easily assembled thin lm transistors light emitting diodes and organic solar cells The use of so called plastic chips ranges from lightweight portable devices over large area applications to gadgets demanding a degree of mechanical exibility which would overstress conventional devices based on inorganic perfect crystals The eld of organic electronics has evolved quite dynamically during the last few years thus consumer electronics based on molecular semiconductors has gained suf cient market attractiveness to be launched by the major manufacturers in the recent past Nonetheless the numerous challenges related to organic device physics and the physics of ordered and disordered molecular solids are still the subjects of a cont uing lively debate The future of organic microelectronics will unavoidably lead to new devi physical insights and hence to novel compounds and device architectures of hanced complexity Thus the early evolution of predictive models and precise computationally effective simulation tools for computer aided analysis and design of promising device prototypes will be of crucial importance

Electronic Databases and Publishing Albert Henderson, 2018-01-18 The true pioneers in electronic publishing put their bibliographic databases on tape and online in the 1960s Nearly all of them had long experience with compiling information for distribution in printed form and a strong market connection As a result of Soviet advances in science and space technology American government support for information science and academic libraries flowed freely for a little over a decade making possible tremendous advances in technology in retrieval techniques and in sophisticated coverage Advances in information technology and market conditions have encouraged many more participants to underwrite the development of databases that now extend into the arts social sciences business and popular interests These essays show how production statistics accompanied by statements of editorial coverage provide a fairly accurate reflection of output of many of the major disciplinary bibliographic databases The urgent priority of information resources in the 1960s has encouraged comprehensive servicing of the formal research literature as published in journals and monographs Authors have counted subject words languages origins types of publication and so on over several decades This volume also includes articles on some databases that are not strictly bibliographic such as the CMG database of college courses which illuminates some of the changes in college textbook publishing Information seekers will find the many tables of practical use as guidance to what and how much may be found within each database Analysts of publishing of science policy and of higher education will find information relevant to expenditures human resources and other indicators of education research and technology activity

Moore's Law Cyrus C. M. Mody, 2016-12-09 How beginning in the mid 1960s the US semiconductor industry helped shape changes in American science including a new orientation to the short term and the commercial Since the mid 1960s American science has undergone significant changes in the way it is organized funded and practiced These changes include the decline of basic research by corporations a new orientation toward the short term and the commercial with pressure on universities and government labs to participate in the market and the promotion of interdisciplinarity In this book Cyrus Mody argues that the changes in American science that began in the 1960s co evolved with and were shaped by the needs of the civilianized US semiconductor industry In 1965 Gordon Moore declared that the most profitable number of circuit components that can be crammed on a single silicon chip doubles every year Mody views Moore's Law less as prediction than as self fulfilling prophecy pointing to the enormous investments of capital people and institutions the semiconductor industry required the long arm of Moore's Law that helped shape all of science Mody offers a series of case studies in microelectronics that illustrate the reach of Moore's Law He describes the pressures on Stanford University's electrical engineers during the Vietnam era IBM's exploration of alternatives to semiconductor technology the emergence of consortia to integrate research across disciplines and universities and the interwoven development of the molecular electronics community and associated academic institutions as the vision of a molecular computer informed the restructuring of research programs

Innovative City in East Asia Poh Kam Wong, 2005 The city state of Singapore has achieved rapid economic development in the past by its positioning as an efficient business hub in Asia To remain competitive in the global knowledge economy however Singapore needs to move beyond efficiency by developing a strong innovative edge as well This paper examines the challenges that Singapore faces in seeking to do so through an explorative survey of 40 firms from three innovative sectors high tech manufacturing industries knowledge intensive business services KIBS and creative content industries Overall while the survey confirms Singapore's continuing competitive strength in efficiency infrastructure it also finds a favorable

perception of Singapore as an innovative city Indeed many of the industry actors indicated that an efficient business infrastructure is a prerequisite for locating their innovative activities in Singapore suggesting that the relationship between innovation and efficiency is complementary rather than substitutional While the study found that intellectual property and its protection are widely recognized by actors in all three sectors interesting differences exist In particular intellectual property protection appears to be of greater concern to the high tech research and development intensive manufacturing sector and the creative contents sector than to the KIBS sector Another interesting difference is that while competition in high tech innovation tends to be global competition in creative content tends to have a stronger local or regional dimension Public policy in East Asia has traditionally emphasized the development of technological innovation capabilities in the manufacturing sector In light of the findings public policymakers may need to be more sensitive to the nuanced differences in policies needed to promote the new creative content industries and the associated supporting KIBS World Bank web site
