Elementary Theory Of Eisenstein Series:

Elementary Theory of L-functions and Eisenstein Series Haruzo Hida, 1993 An elementary but detailed insight into the theory of L functions The presentation is self contained and concise **Elementary Theory of Eisenstein Series** Tomio Kubota, 1973 **The Theory of Eisenstein Systems**, 1982-01-06 The Theory of Eisenstein Systems *Euler Products and Eisenstein Series* Gorō Shimura, This volume has three chief objectives 1 the determination of local Euler factors on classical groups in an explicit rational form 2 Euler products and Eisenstein series on a unitary group of an arbitrary signature and 3 a class number formula for a totally definite hermitian form Though these are new results that have never before been published Shimura starts with a quite general setting He includes many topics of an expository nature so that the book can be viewed as an introduction to the theory of automorphic forms of several variables Hecke theory in particular Eventually the exposition is specialized to unitary groups but they are treated as a model case so that the reader can easily formulate the corresponding facts for other groups There are various facts on algebraic groups and their localizations that are standard but were proved in some old papers or just called well known In this book the reader will find the proofs of many of them as well as systematic expositions of the topics This is the first book in which the Hecke theory of a general nonsplit classical group is treated The book is practically self contained except that familiarity with algebraic number theory is assumed

Iwasawa Theory 2012 Thanasis Bouganis, Otmar Venjakob, 2014-12-08 This is the fifth conference in a bi annual series following conferences in Besancon Limoges Irsee and Toronto The meeting aims to bring together different strands of research in and closely related to the area of Iwasawa theory During the week before the conference in a kind of summer school a series of preparatory lectures for young mathematicians was provided as an introduction to Iwasawa theory Iwasawa theory is a modern and powerful branch of number theory and can be traced back to the Japanese mathematician Kenkichi Iwasawa who introduced the systematic study of \mathbb{Z}_p extensions and p adic L functions concentrating on the case of ideal class groups Later this would be generalized to elliptic curves Over the last few decades considerable progress has been made in automorphic Iwasawa theory e g the proof of the Main Conjecture for $GL(2)$ by Kato and Skinner Urban Techniques such as Hida s theory of p adic modular forms and big Galois representations play a crucial part Also a noncommutative Iwasawa theory of arbitrary p adic Lie extensions has been developed This volume aims to present a snapshot of the state of art of Iwasawa theory as of 2012 In particular it offers an introduction to Iwasawa theory based on a preparatory course by Chris Wuthrich and a survey of the proof of Skinner Urban based on a lecture course by Xin Wan

Harmonic Analysis on Symmetric Spaces—Higher Rank Spaces, Positive Definite Matrix Space and Generalizations Audrey Terras, 2016-04-26 This text is an introduction to harmonic analysis on symmetric spaces focusing on advanced topics such as higher rank spaces positive definite matrix space and generalizations It is intended for beginning graduate students in mathematics or researchers in physics or engineering As with the introductory book entitled *Harmonic Analysis on Symmetric Spaces Euclidean Space the Sphere and the Poincaré Upper Half Plane* the style is informal with an emphasis on motivation concrete examples history and

applications The symmetric spaces considered here are quotients $X = G/K$ where G is a non compact real Lie group such as the general linear group $GL_n(\mathbb{R})$ of all $n \times n$ non singular real matrices and K is the maximal compact subgroup of orthogonal matrices Other examples are Siegel's upper half plane and the quaternionic upper half plane In the case of the general linear group one can identify X with the space P_n of $n \times n$ positive definite symmetric matrices Many corrections and updates have been incorporated in this new edition Updates include discussions of random matrix theory and quantum chaos as well as recent research on modular forms and their corresponding L functions in higher rank Many applications have been added such as the solution of the heat equation on P_n the central limit theorem of Donald St P Richards for P_n results on densest lattice packing of spheres in Euclidean space and GL_n analogs of the Weyl law for eigenvalues of the Laplacian in plane domains Topics featured throughout the text include inversion formulas for Fourier transforms central limit theorems fundamental domains in X for discrete groups such as the modular group $GL_n(\mathbb{Z})$ of $n \times n$ matrices with integer entries and determinant 1 connections with the problem of finding densest lattice packings of spheres in Euclidean space automorphic forms Hecke operators L functions and the Selberg trace formula and its applications in spectral theory as well as number theory

Dynamical, Spectral, and Arithmetic Zeta Functions Michel Laurent Lapidus, Machiel Van Frankenhuysen, 2001 The original zeta function was studied by Riemann as part of his investigation of the distribution of prime numbers Other sorts of zeta functions were defined for number theoretic purposes such as the study of primes in arithmetic progressions This led to the development of L functions which now have several guises It eventually became clear that the basic construction used for number theoretic zeta functions can also be used in other settings such as dynamics geometry and spectral theory with remarkable results This volume grew out of the special session on dynamical spectral and arithmetic zeta functions held at the annual meeting of the American Mathematical Society in San Antonio but also includes four articles that were invited to be part of the collection The purpose of the meeting was to bring together leading researchers to find links and analogies between their fields and to explore new methods The papers discuss dynamical systems spectral geometry on hyperbolic manifolds trace formulas in geometry and in arithmetic as well as computational work on the Riemann zeta function Each article employs techniques of zeta functions The book unifies the application of these techniques in spectral geometry fractal geometry and number theory It is a comprehensive volume offering up to date research It should be useful to both graduate students and confirmed researchers

Proceedings of the Second ISAAC Congress Heinrich G.W. Begehr, R.P. Gilbert, Joji Kajiwara, 2013-12-01 Let Σ be a Riemann surface of analytically finite type of genus g with $2n$ boundary components. Take two points $P_1, P_2 \in \Sigma$ and set $\pi = \pi_{1,2}(\Sigma, P_1, P_2)$. Let $\text{Homeo}(\Sigma, P_1, P_2)$ be the group of all orientation preserving homeomorphisms $\phi: \Sigma \rightarrow \Sigma$ fixing P_1, P_2 and isotopic to the identity on Σ . Denote by $\text{Homeo}(\Sigma, P_1, P_2)$ the set of all elements of $\text{Homeo}(\Sigma, P_1, P_2)$ isotopic to the identity on Σ . Then $\text{Homeo}(\Sigma, P_1, P_2)$ is a normal subgroup of $\text{Homeo}(\Sigma, P_1, P_2)$. We set $\text{Isot}(\Sigma, P_1, P_2) = \text{Homeo}(\Sigma, P_1, P_2) / \text{Homeo}(\Sigma, P_1, P_2)$. The purpose of this note is to announce a result on the Nielsen-Thurston-Bers type classification of an element w of $\text{Isot}(\Sigma, P_1, P_2)$. We give a necessary and sufficient condition for the type to be hyperbolic. The condition is described in terms of properties of the pure braid b_w induced by w . Proofs will appear elsewhere. The problem considered in this note and the form of the solution are suggested by Kra's beautiful theorem in [6] where he treats self maps of Riemann surfaces with one specified point. The classification due to Bers. Let us recall the classification of elements of the mapping class group due to Bers see Bers [1]. Let $T(R)$ be the Teichmüller space of a Riemann surface R and $\text{Mod } R$ be the Teichmüller modular group of R . Note that an orientation preserving homeomorphism $w: R \rightarrow R$ induces canonically an element $w \in \text{Mod } R$. Denote by d_R the Teichmüller distance on $T(R)$. For an element $X \in \text{Mod } R$ we define $\alpha_X = \inf_{R \rightarrow R} d_R(X, \text{id})$.

The Theory of Zeta-Functions of Root Systems Yasushi Komori, Kohji Matsumoto, Hirofumi Tsumura, 2024-01-02 The contents of this book was created by the authors as a simultaneous generalization of Witten zeta functions, Mordell-Tornheim multiple zeta functions and Euler-Zagier multiple zeta functions. Zeta functions of root systems are defined by certain multiple series given in terms of root systems. Therefore they intrinsically have the action of associated Weyl groups. The exposition begins with a brief introduction to the theory of Lie algebras and root systems and then provides the definition of zeta functions of root systems, explicit examples associated with various simple Lie algebras, meromorphic continuation and recursive analytic structure described by Dynkin diagrams, special values at integer points, functional relations and the background given by the action of Weyl groups. In particular, an explicit form of Witten's volume formula is provided. It is shown that various relations among special values of Euler-Zagier multiple zeta functions which usually are called multiple zeta values (MZVs) and are quite important in connection with Zagier's conjecture are just special cases of various functional relations among zeta functions of root systems. The authors further provide other applications to the theory of MZVs and also introduce generalizations with Dirichlet characters and with certain congruence conditions. The book concludes with a brief description of other relevant topics.
