Gil, Richard D. Wood, 2021-03-18 Designing engineering components that make optimal use of materials requires consideration of the nonlinear static and dynamic characteristics associated with both manufacturing and working environments The modeling of these characteristics can only be done through numerical formulation and simulation which requires an understanding of both the theoretical background and associated computer solution techniques By presenting nonlinear solid mechanics dynamic conservation laws and principles and the associated finite element techniques together the authors provide in this second book a unified treatment of the dynamic simulation of nonlinear solids Alongside a number of worked examples and exercises are user instructions program descriptions and examples for two MATLAB computer implementations for which source codes are available online While this book is designed to complement postgraduate courses it is also relevant to those in industry requiring an appreciation of the way their computer simulation programs work *Elements of Newtonian Mechanics* Jens M. Knudsen, Poul G. Hjorth, 2002-08-28 In the third edition a number of minor misprints that appeared in the second edition have been corrected Furthermore 17 new problems have been added at the end of chapters 6 8 9 11 12 13 and 14 The answers to these 17 problems have not been listed in the Answers section at the end of the book This will permit the problems to be used as hand in problems or perhaps in mid term exams JMK 9 PGH Copenhagen May 2000 Preface to the Second Edition In the second edition a number of misprints that appeared in the first edition have been corrected In addition to this we have made improvements based on the experience gathered in the use of the first English edition of the book in the introductory course in physics at the University of Copenhagen A chapter introducing nonlinear dynamics has been added The purpose of this chapter is to provide supplementary reading for the students who are interested in this area of active

research where Newtonian mechanics plays an essential role The students who wish to dig deeper should consult texts dedicated to the study of nonlinear dynamical systems and chaos The literature list at the end of this book contains several references for the topic

A New Kirchhoff-Love Beam Element and its Application to Polymer Mechanics Matthias C. Schulz, 2022-09-21 The novel finite element formulations fall into the category of geometrically exact Kirchhoff Love beams A prominent characteristic of this category is that the absence of shear deformation is strongly enforced by removing two degrees of freedom Further the corresponding beam theories exhibit not only translational but also rotational degrees of freedom and their configurations thus form a non additive and non commutative space Sophisticated interpolation schemes are required that need to be tested not only for locking spatial convergence behavior and energy conservation but also for observer invariance and path independence For the three novel beam element formulations all these properties are analytically and numerically studied and confirmed if applicable Two different rotation parameterization strategies are employed based on the well known geodesic interpolation used in many Simo Reissner beams and the lesser known split into the so called textit smallest rotation and a torsional part Application of the former parameterization results in a mixed finite element formulation intrinsically free of locking phenomena Additionally the first geometrically exact Kirchhoff Love beam element is presented which strongly enforces inextensibility by removing another degree of freedom Furthermore the numerical efficiency of the new beam formulations is compared to other beam elements that allow for or suppress shear deformation When modeling very slender beams the new elements offer distinct numerical advantages Standard molecular dynamics simulations which are commonly used to study polymers suffer from a lack of a careful mathematical basis and the use of an expensive explicit time integration scheme To circumvent these

shortcomings and to be able to simulate stretching experiments on relevant time scales the problem is described by a stochastic partial differential equation which can be solved using the finite element method with a backward Euler temporal discretization In detail the polymer is represented by a Kirchhoff Love beam with a linear elastic constitutive model Inertial and electrostatic forces are neglected It is deformed by a distributed load mimicking collisions with molecules of the surrounding fluid Naturally this load heavily fluctuates over time and space and mean values need to be computed in a Monte Carlo manner To vastly speed up the fitting process to experimental data in a Bayesian framework a surrogate model based on a Gaussian process is set up which directly computes the mean values for given material parameters The uncertainties and correlations of the material parameters are studied and compared to the literature
