The Quaternary

Geology is a science of such rapid growth that no apology is expected when from time to time a new text book is added to those already in the field

The present work however is the outcome of the need of a text book of very simple outline in which causes and their consequences should be knit together as closely as possible a need long felt by the author in his teaching and perhaps by other teachers also

Geology is a science of such rapid growth that no apology is expected when from time to time a new text book is added to those already in the field

The present work however is the outcome of the need of a text book of very simple outline in which causes and their consequences should be knit together as closely as possible a need long felt by the author in his teaching and perhaps by other teachers also

The author has ventured therefore to depart from the common usage which subdivides geology into a number of departments

dynamical

structural

physiographic

and historical

and to treat in immediate connection with each geological process the land forms and the rock structures which it has produced

It is hoped that the facts of geology and the inferences drawn from them have been so presented as to afford an efficient discipline in inductive reasoning

Typical examples have been used to introduce many topics and it has been the author's aim to give due proportion to both the wide generalizations of our science and to the concrete facts on which they rest

There have been added a number of practical exercises such as the author has used for several years in the class room

These are not made so numerous as to displace the problems which no doubt many teachers prefer to have their pupils solve impromptu during the recitation but may it be hoped suggest their use

Aimed at B Sc students of geology this introductory text develops a basic understanding of the Earth as a complex evolving system of geological processes

This book will also be of immense use to those postgraduate students of geology who opt for this stream after graduating in disciplines other than geology

Geology as a science has recently gained increasing importance because of the current developments in oil and mineral exploration and also because of recent occurrences of earthquakes and tsunamis

This book covers the entire spectrum of the geologic

concepts and relates them to the main processes of geomorphology earthquakes and volcanoes Important types of the three categories of rocks igneous sedimentary and metamorphic that form the crust of the Earth are described with their characteristic mineralogy Major structures that are born of tectonic activities are discussed Palaeontological descriptions cover not only the plant and animal groups but also other evidences of life in the geological record and evolution An important feature of the text is that modern stratigraphic methods of classification are outlined clearly and the latest geologic time scale with numerical ages as approved in 2004 by the International Commission on Stratigraphy of the International Union of Geological Sciences is incorporated
