

MASS EXTINCTIONS

A mass extinction is a sharp spike in the rate of extinction of species caused by a catastrophic event, or rapid environmental change. Scientists have been able to identify five mass extinctions in Earth's history, each of which led to a loss of more than 75 percent of animal species.

1. ORDOVICIAN-SILURIAN EXTINCTION 440 MILLION YEARS AGO (MA)

Scientists theorize that there were two main phases to this extinction: a glaciation event and a heating event. Abundant plant life removed carbon dioxide (CO₂) from the air, causing global cooling and glacier formation. This led to a drop in sea levels, reducing habitat. Later came global warming and sea level rising again. Creatures that had adapted to the cooler climate were unable to survive the increased temperature. Since most life was marine at the time, 80% of life was lost.

86% LOSS

2. LATE DEVONIAN EXTINCTION—365 MA

About 70% of life died off during this period. One theory suggests that land plants developed deep roots, releasing an abundance of nutrients into the oceans that led algae. Because of this, algae blooms consumed vast amounts of oxygen (O₂) in the oceans, suffocating many species. Another theory suggests that another global cooling took place, resulting in glaciation and a fall in sea level, leading to habitat loss.

75% LOSS

3. PERMIAN-TRIASSIC EXTINCTION—252 MA

The Permian-Triassic was the deadliest extinction in history: 90% of all life perished. Scientists believe that volcanic activity in Siberia put massive amounts of carbon dioxide, a greenhouse gas, into the atmosphere. Bacteria that thrive on CO₂ began producing methane, another greenhouse gas. Large quantities of both gases warmed the planet and combined with Earth's water, making the oceans and sea acids, creating a highly toxic environment for life.

96% LOSS

4. TRIASSIC-JURASSIC EXTINCTION—201.3 MA

Some scientists theorize that volcanic eruptions spewed tons of CO₂ into the atmosphere, which trapped heat and acidified the oceans, causing this mass extinction. Other scientists contend that an asteroid or comet impact triggered the extinction. About 80% of life was lost in this extinction, including most of the dinosaurs, making way for the dinosaur's extinction.

80% LOSS

5. CRETACEOUS-PALEOGENE EXTINCTION—66 MA

The Cretaceous-Paleogene extinction wiped out the dinosaurs, along with 60-70% of all life on Earth. A widely accepted theory is that an asteroid landed in the Yucatán Peninsula in Mexico and killed the dinosaurs. The impact would have ejected enormous amounts of debris into the atmosphere, causing global temperatures to drop. The impact may have also caused local fires, earthquakes, tsunamis, and acid rain.

60-76% LOSS

6. HOLOCENE EXTINCTION 11,700 YEARS AGO TO PRESENT

The next mass extinction may already be happening. The current extinction rate is at least a thousand times greater than the "normal" extinction rate. A "normal" or background extinction rate is the average rate of extinction based on the longevity of species through time without human influence, determined by the fossil record. Scientists believe that human impact on the environment is the leading cause of extinctions today.

Extinctions In Near Time:

Extinctions in Near Time R. D. E. MacPhee, 1999-06-30 This book examines an important and growing issue among ecologists conservation biologists and archaeologists namely recent extinction of species and will focus on treatments of losses thought to have been caused by humans in some way over the past 40 000 years when Homo sapiens spread worldwide There is an exemplary list of leading figures in this debate and the book should have impact for the debate on current conservation issues and biodiversity

Extinctions in Near Time Ross D.E. MacPhee, Hans-Dieter Sues, 2013-11-09 Near time an interval that spans the last 100 000 years or so of earth history qualifies as a remarkable period for many reasons From an anthropocentric point of view the out standing feature of near time is the fact that the evolution cultural diversification and glob al spread of Homo sapiens have all occurred within it From a wider biological perspective however the hallmark of near time is better conceived of as being one of enduring repeat ed loss The point is important Despite the sense of uniqueness implicit in phrases like the biodiversity crisis meant to convey the notion that the present bout of extinctions is by far the worst endured in recent times substantial losses have occurred throughout near time In the majority of cases these losses occurred when and only when people began to ex pand across areas that had never before experienced their presence Although the explana tion for these correlations in time and space may seem obvious it is one thing to rhetorically observe that there is a connection between humans and recent extinctions and quite another to demonstrate it scientifically How should this be done Traditionally the study of past extinctions has fallen largely to researchers steeped in such disciplines as paleontology systematics and paleoecology The evaluation of future losses by contrast has lain almost exclusively within the domain of conservation biologists Now more than ever there is opportunity for overlap and sharing of information

Palaeobiology II Derek E. G. Briggs, Peter R. Crowther, 2001-03-05 Palaeobiology A Synthesis was widely acclaimed both for its content and production quality Ten years on Derek Briggs and Peter Crowther have once again brought together over 150 leading authorities from around the world to produce Palaeobiology II Using the same successful formula the content is arranged as a series of concise articles taking a thematic approach to the subject rather than treating the various fossil groups systematically This entirely new book with its diversity of new topics and over 100 new contributors reflects the exciting developments in the field including accounts of spectacular newly discovered fossils and embraces data from other disciplines such as astrobiology geochemistry and genetics Palaeobiology II will be an invaluable resource not only for palaeontologists but also for students and researchers in other branches of the earth and life sciences Written by an international team of recognised authorities in the field Content is concise but informative Demonstrates how palaeobiological studies are at the heart of a range of scientific themes

American Megafaunal Extinctions at the End of the Pleistocene Gary Haynes, 2008-12-23 The volume contains summaries of facts theories and unsolved problems pertaining to the unexplained extinction of dozens of genera of mostly large terrestrial mammals which occurred ca 13 000 calendar

years ago in North America and about 1 000 years later in South America Another equally mysterious wave of extinctions affected large Caribbean islands around 5 000 years ago The coupling of these extinctions with the earliest appearance of human beings has led to the suggestion that foraging humans are to blame although major climatic shifts were also taking place in the Americas during some of the extinctions The last published volume with similar but not identical themes *Extinctions in Near Time* appeared in 1999 since then a great deal of innovative exciting new research has been done but has not yet been compiled and summarized Different chapters in this volume provide in depth resum s of the chronology of the extinctions in North and South America the possible insights into animal ecology provided by studies of stable isotopes and anatomical physiological characteristics such as growth increments in mammoth and mastodont tusks the clues from taphonomic research about large mammal biology the applications of dating methods to the extinctions debate and archeological controversies concerning human hunting of large mammals

Foundations of the Earth H.H. Shugart, 2014-07-08 Where were you when I laid the foundation of the earth God asks Job in the Whirlwind Speech but Job cannot reply This passage which some environmentalists and religious scholars treat as a green creation myth drives renowned ecologist H H Shugart's extraordinary investigation in which he uses verses from God's speech to Job to explore the planetary system animal domestication sea level rise evolution biodiversity weather phenomena and climate change Shugart calls attention to the rich resonance between the Earth's natural history and the workings of religious feeling the wisdom of biblical scripture and the arguments of Bible ethicists The divine questions that frame his study are quintessentially religious and the global changes humans have wrought on the Earth operate not only in the physical chemical and biological spheres but also in the spiritual realm Shugart offers a universal framework for recognizing and confronting the global challenges humans now face the relationship between human technology and large scale environmental degradation the effect of invasive species on the integrity of ecosystems the role of humans in generating wide biotic extinctions and the future of our oceans and tides **End of the Megafauna: The Fate of the World's Hugest, Fiercest, and Strangest Animals** Ross D E MacPhee, 2018-11-13 The fascinating lives and puzzling demise of some of the largest animals on earth Until a few thousand years ago creatures that could have been from a sci fi thriller including gorilla sized lemurs 500 pound birds and crocodiles that weighed a ton or more roamed the earth These great beasts or megafauna lived on every habitable continent and on many islands With a handful of exceptions all are now gone What caused the disappearance of these prehistoric behemoths No one event can be pinpointed as a specific cause but several factors may have played a role Paleomammalogist Ross D E MacPhee explores them all examining the leading extinction theories weighing the evidence and presenting his own conclusions He shows how theories of human overhunting and catastrophic

Zoologist *Extinction and Biogeography of Tropical Pacific Birds* David W. Steadman,2006-10-15 Publisher Description

Stochastic Population Dynamics in Ecology and Conservation Russell Lande,Steinar Engen,Bernt-Erik Sæther,2003 All populations fluctuate stochastically creating a risk of extinction that does not exist in deterministic models with fundamental consequences for both pure and applied ecology This book provides the most comprehensive introduction to

stochastic population dynamics combining classical background material with a variety of modern approaches including new and previously unpublished results by the authors illustrated with examples from bird and mammal populations and insect communities Demographic and environmental stochasticity are introduced with statistical methods for estimating them from field data The long run growth rate of a population is explained and extended to include age structure with both demographic and environmental stochasticity Diffusion approximations facilitate the analysis of extinction dynamics and the duration of the final decline Methods are developed for estimating delayed density dependence from population time series using life history data Metapopulation viability and the spatial scale of population fluctuations and extinction risk are analyzed Stochastic dynamics and statistical uncertainty in population parameters are incorporated in Population Viability Analysis and strategies for sustainable harvesting Statistics of species diversity measures and species abundance distributions are described with implications for rapid assessments of biodiversity and methods are developed for partitioning species diversity into additive components Analysis of the stochastic dynamics of a tropical butterfly community in space and time indicates that most of the variance in the species abundance distribution is due to ecological heterogeneity among species so that real communities are far from neutral

Throwing Fire Alfred W. Crosby, 2002-04-08 Historian Alfred W Crosby looks at hard accurate throwing and the manipulation of fire as unique human capabilities Humans began throwing rocks in prehistory and then progressed to javelins atlatls bows and arrows We learned to make fire by friction and used it to cook drive game burn out rivals and alter landscapes In historic times we invented catapults trebuchets and such flammable liquids as Greek Fire About 1 000 years ago we invented gunpowder which accelerated the rise of empires and the advance of European imperialism In the 20th century gunpowder weaponry enabled us to wage the most destructive wars of all time peaking at the end of World War II with the V 2 and atomic bomb Today we have turned our projectile talents to space travel which may make it possible for our species to migrate to other bodies of our solar system and even other star systems

Native Americans and the Environment Michael Eugene Harkin, David Rich Lewis, 2007-01-01 Often cited as one of the most decisive campaigns in military history the Seven Days Battles were the first campaign in which Robert E Lee led the Army of Northern Virginia as well as the first in which Lee and Thomas Stonewall Jackson worked together
