Face Detection and Modeling for Recognition Rein-Lien Hsu, 2002 Face recognition has received substantial attention from researchers in biometrics computer vision pattern recognition and cognitive psychology communities because of the increased attention being devoted to security man machine communication content based image retrieval and image video coding We have proposed two automated recognition paradigms to advance face recognition technology Three major tasks involved in face recognition systems are i face detection ii face modeling and iii face matching We have developed a face detection algorithm for color images in the presence of various lighting conditions as well as complex backgrounds Our detection method first corrects the color bias by a lighting compensation technique that automatically estimates the parameters of reference white for color correction We overcame the difficulty of detecting the low luma and high luma skin tones by applying a nonlinear transformation to the Y CbCr color space Our method generates face candidates based on the spatial arrangement of detected skin patches We constructed eye mouth and face boundary maps to verify each face candidate Experimental results demonstrate successful detection of faces with different sizes color position scale orientation 3D pose and expression in several photo collections 3D human face models augment the appearance based face recognition approaches to assist face recognition under the illumination and head pose variations For the two proposed recognition paradigms we have designed two methods for modeling human faces based on i a generic 3D face model and an individual s facial measurements of shape and texture captured in the frontal view and ii alignment of a semantic face graph derived from a generic 3D face model onto a frontal face image

Face Recognition in Adverse Conditions De Marsico, Maria, 2014-04-30 Facial recognition software has improved by leaps and bounds over the past few decades with error rates decreasing significantly within the past ten years Though this is true conditions such as poor lighting obstructions and profile only angles have continued to persist in preventing wholly accurate readings Face Recognition in Adverse Conditions examines how the field of facial recognition takes these adverse conditions into account when designing more effective applications by discussing facial recognition under real world PIE variations current applications and the future of the field of facial recognition research The work is intended for academics engineers and researchers specializing in the field of facial recognition When Face Recognition Goes Wrong Catriona

Havard,2024-10-29 When Face Recognition Goes Wrong explores the myriad ways that humans and machines make mistakes in facial recognition Adopting a critical stance throughout the book explores why and how humans and machines make mistakes covering topics including racial and gender biases neuropsychological disorders and widespread algorithm problems The book features personal anecdotes alongside real world examples to showcase the often life changing consequences of facial recognition going wrong These range from problems with everyday social interactions through to eyewitness identification leading to miscarriages of justice and border control passport verification Concluding with a look to the future of facial recognition the author asks the world s leading experts what are the big questions that still need to be answered and can we train humans and machines to be super recognisers This book is a must read for anyone interested in facial recognition or in psychology criminal justice and law

Reviews, Refinements and New Ideas in Face

Recognition Peter Corcoran,2011-07-27 As a baby one of our earliest stimuli is that of human faces We rapidly learn to identify characterize and eventually distinguish those who are near and dear to us We accept face recognition later as an everyday ability We realize the complexity of the underlying problem only when we attempt to duplicate this skill in a computer vision system This book is arranged around a number of clustered themes covering different aspects of face recognition The first section on Statistical Face Models and Classifiers presents reviews and refinements of some well known statistical models The next section presents two articles exploring the use of Infrared imaging techniques and is followed by few articles devoted to refinements of classical methods New approaches to improve the robustness of face analysis techniques are followed by two articles dealing with real time challenges in video sequences A final article explores human perceptual issues of face recognition

Face Detection and Gesture Recognition for Human-Computer Interaction

Ming-Hsuan Yang,Narendra Ahuja,2012-12-06 Traditionally scientific fields have defined boundaries and scientists work on

research problems within those boundaries. However, from time to time those boundaries get shifted or blurred to evolve new fields. For instance, the original goal of computer vision was to understand a single image of a scene by identifying objects, their structure, and spatial arrangements. This has been referred to as image understanding. Recently, computer vision has gradually been making the transition away from understanding single images to analyzing image sequences or video understanding. Video understanding deals with understanding of video sequences, e.g., recognition of gestures, activities, facial expressions, etc. The main shift in the classic paradigm has been from the recognition of static objects in the scene to motion-based recognition of actions and events. Video understanding has overlapping research problems with other fields, therefore blurring the fixed boundaries. Computer graphics, image processing, and video databases have obvious overlap with computer vision. The main goal of computer graphics is to generate and animate realistic-looking images and videos. Researchers in computer graphics are increasingly employing techniques from computer vision to generate the synthetic imagery. A good example of this is image-based rendering and modeling techniques in which geometry, appearance, and lighting is derived from real images using computer vision techniques. Here, the shift is from synthesis to analysis followed by synthesis.

Face Recognition Harry Wechsler, Jonathon P. Phillips, Vicki Bruce, Francoise Fogelman Soulie, Thomas S. Huang, 2012-12-06. The NATO Advanced Study Institute (ASI) on Face Recognition: From Theory to Applications took place in Stirling, Scotland, UK, from June 23 through July 4, 1997. The meeting brought together 95 participants, including 18 invited lecturers from 22 countries. The lecturers are leading researchers from academia, government, and industry from all over the world. The lecturers presented an encompassing view of face recognition and identified trends for future developments and the means for implementing robust face recognition systems. The scientific programme consisted of invited lectures, three panels, and oral and poster presentations from students attending the ASI. As a result of lively interactions between the participants, the following topics emerged as major themes of the meeting: i) human processing of face recognition and its relevance to forensic systems; ii) face coding; iii) connectionist methods and support vector machines (SVM); iv) hybrid methods for face recognition; and v) predictive learning and performance evaluation. The goals of the panels were to provide links among the lectures and to emphasize the themes of the meeting. The topics of the panels were: i) How the human visual system processes faces; ii) Issues in applying face recognition databases, evaluation, and systems; and iii) Classification issues involved in face recognition. The presentations made by students gave them an opportunity to receive feedback from the invited lecturers and suggestions for future work.

Face Recognition Sam S. Rakover, Baruch Cahlon, 2001. Annotation: In 1997, Rakover (U of Haifa) and Cahlon (Oakland U, Michigan) won an award from the Minister of Internal Security of the State of Israel for developing the Catch model for face recognition. Since then, they have proposed the Law of Face Recognition by Similarity. Here, they describe the computer and mathematical research they have conducted and some of their results.
