Pashley, 2001 This volume contains six important articles in materials science and materials engineering based upon inaugural lectures given by professors at Imperial College London Each author deals with an area of work in which he has been involved over a period of years and gives a personal account partly historical of the main features and importance of his subject The topics covered include the strength and deformation of metals the brittle behaviour of ceramics electrical materials biomaterials friction and lubrication and modern engineering adhesives Contents Slippery Customers Sticky Problems B J Briscoe Sticking Up for Adhesives A J Kinloch Magical Materials for Motionless Machines D B Holt Interfaces in Materials OCo If You Can t Beat them Join Them A Atkinson Brittleness OCo A Tough Problem R D Rawlings The Story of Bioglass From Concept to Clinic L L Hench Readership Scientists and engineers with a general interest in materials science and materials engineering Tribology in Metalworking John A. Schey, 1983 Numerical Modelling of Material Deformation Processes Peter Hartley, Ian Pillinger, Clive E.N. Sturgess, 2012-12-06 The principal aim of this text is to encourage the development and application of numerical modelling techniques as an aid to achieving greater efficiency and

optimization of metal forming processes The contents of this book have therefore been carefully planned to provide both an introduction to the fundamental theory of material deformation simulation and also a comprehensive survey of the state of the art of deformation modelling techniques and their application to specific and industrially relevant processes To this end leading international figures in the field of material deformation research have been invited to contribute chapters on subjects on which they are acknowledged experts The information in this book has been arranged in four parts Part I deals with plasticity theory Part II with various numerical modelling techniques Part III with specific process applications and material phenomena and Part IV with integrated computer systems The objective of Part I is to establish the underlying theory of material deformation on which the following chapters can build It begins with a chapter which reviews the basic theories of classical plasticity and describes their analytical representations The second chapter moves on to look at the theory of deforming materials and shows how these expressions may be used in numerical techniques The last two chapters of Part I provide a review of isotropic plasticity and anisotropic plasticity

Handbook of Workability and Process Design George E. Dieter,Howard A. Kuhn,S. Lee Semiatin,2003-01-01

Introduction to Manufacturing Processes John A. Schey,1987 This revision aims to address changes that have taken effect since the publication of the second edition The most significant change has been in the attitude of industry to concurrent engineering In 1987 mostly lip service was paid to it today it has become general practice in most competitive corporations In the second edition the author discussed this as the manufacturing system In the third edition it becomes the focal point Concurrent engineering involves

the whole product realization process including product concept performance criteria mechanical design and analysis materials selection process planning and modeling production control automation assembly management and others An introductory text cannot possibly cover all of these topics hence the emphasis of the third edition remains on the physical principles and the application of these principles to processes The major difference relative to the second edition will be the emphasis on interactions between process and design Capabilities and limitations of processes will be highlighted to show what they mean in terms of design possibilities and design modifications will be suggested for ease of manufacture Impact on the environment and possibilities for recycling will be woven into the entire text

Metal Deformation Processing F. W. Boulger, A. F. Gerds, R. L. Jentgen, G. E. Meyer, H. L. D. Pugh, Alan R. Rosenfield, D. E. Strohecker, Volker Weiss, 1967 As part of the Metalworking Processes and Equipment Program information was collected on deformation characteristics of metals and their effect on processing operations The report presents the information collected from technical engineering reports on Government contracts and from general engineering and metallurgical publications The objective is to help the nonspecialist in recognizing the implications of scientific findings and in applying them in specific operations This report contains a series of articles covering the following subjects Ductile Fracture Application of High Pressure to the Forming of Brittle Metals Superplasticity Lubrication in Metal Deformation Processes Swaging Adiabatic Conditions in Deformation Processing Residual Stresses produced by Deformation These subjects are treated in two ways 1 generalized discussions of common processes point out why specific variables must be modified in order to deform certain types of metals satisfactorily and 2 data on the more difficult to form metals are used to illustrate the principles limitations and effects of the processes Author
